ABOUT NTIS

The National Technical Information Service of the U.S. Department of Commerce is the central source for the public sale of Government-sponsored research, development, and engineering reports and other analyses prepared by Federal agencies, their contractors or grantees, or by Special Technology Groups. NTIS also is a central source for federally generated machine processable data files.

NTIS ships about 23,000 information products daily as one of the world's leading processors of specialty information. It supplies its customers with about 4 million documents and microforms annually. The NTIS information collection exceeds 1 million titles and all are available for sale. About 80,000 titles are stocked in multiple copies. Current lists of best selling reports describe those most in demand.

NTIS sells subscriptions, technical reports, and other information products and services of specialized interest under provisions of Title 15, U.S. Code 1151-7. This law, which establishes NTIS as a clearinghouse for scientific, technical, and engineering information, also directs NTIS to be self-supporting, to recover all its costs from the sales of products and services. All costs of NTIS products and services, including salaries, rent, utilities, marketing, promotion, and postage—and all the other usual costs of doing business—are paid from sales income, not by tax-supported Congressional appropriation.

Customers may quickly locate summaries of interest from among some 680,000 federally sponsored research reports completed and published from 1964 to date, using the agency's on-line computer search service (NTISearch) or more than 1,000 Published Searches. About 70,000 new summaries and reports are added annually.

The NTIS Bibliographic Data File (on magnetic tape) includes unpublished research summaries and is available for lease. The computer products of other Federal agencies also are sold or leased by NTIS.

Summaries of current research reports and other specialized information in various categories of interest are published in a wide variety of weekly abstract newsletters and indexed. An all-inclusive biweekly journal (Government Reports Announcements & Index) is published for librarians, technical information specialists, and those requiring all the summaries in a single volume.

A standing order microfiche service, Selected Research In Microfiche (SRIM), automatically provides subscribers with the full texts of research reports specially selected to satisfy individual requirements. Automatic distribution of paper copies also is available.

Additional services, such as the coordination, packaging, and marketing of unusual information for individuals and organizations may be specially designed.

These and many other information products and services are described in the free NTIS general catalog (PR-154).

HOW TO ORDER

Availability

NTIS announces reports supplied from many sources; copies of most items, but not all, are available from NTIS. Some reports must be obtained from other sources and those are noted.

In the Reports Announcements section (the first section of GRA&I), each bibliographic entry shows where the document may be obtained. NTIS shows such information in two places in its citations—a short, primary entry on the first line of the citation to the right of the NTIS order number, and a secondary entry that immediately precedes the abstract.

Reports available from NTIS have various price codes, actual prices, or the word "Subscription" printed in the primary availability statement. Reports not available from NTIS have the words "Not Available NTIS" printed there.

Not Available NTIS

To find where to order reports listed as "Not Available NTIS," look to the entry just before the abstract for the secondary availability statement. There are a variety of statements on availability varying from an entry that tells where the report was published to specific ordering instructions such as "Paper copy available from ERIC Document Reproduction Service." When NTIS can supply specific ordering instructions, it does so. However, when such information is not available to NTIS, contact your local librarian who may be able to help you.

Paper and Microfiche Copies

If the primary availability statement has a price code entry such as "PC AO4/MF AO1," you can place your order directly with NTIS. A report may be available in paper copy (PC) or microfiche (MF) or both; if both forms are available, price codes will be given for both PC and MF. To determine the current price, consult the price-code table printed on the outside back cover of the most current issue of GRA&I. Then, please use the order form bound into GRA&I, or a copy, to place your order. Be sure to include the NTIS order

number, the quantity, form, and the order fulfillment options you want—eg, magnetic tape mode.

Other Microforms and Subscriptions
If the report is offered on a subscription basis, or as 16 or 35mm microfilm, the secondary availability statement will so indicate. You may need to write or telephone NTIS for specific instructions on ordering such material; if you have any questions, please write or telephone for clarification (703-487-4630).

Order Fulfillment Options
NTIS offers three order fulfillment options; REGULAR, PREMIUM, and RUSH. If you need assistance with your order, NTIS offers an identification service for NTIS order numbers, prices, and availability. To expedite the identification service, a telephone answering device is used (703-487-4780). Your recorded questions are answered by mail the following working day.

Regular Service. Your order can be placed by mail, by telephone, or in person at one of our sales desks. Current U.S. Postal Service parcel post delivery time is from nine to 30 days. You can request delivery by first class mail (surcharge of $3 for each copy ordered to North American Continent addresses) or, if you are not a North American Continent customer, you may request foreign airmail (surcharge of $4 per copy ordered). You man elect to pick up at the NTIS Springfield sales desk (5285 Port Royal Road, Springfield, VA 22161, telephone (703-487-4650) or at the NTIS District of Columbia sales desk (Suite 620, 425 Thirteenth St., N.W., Washington,DC 20004, telephone 202-724-3382). If you elect personal pickup, the receptionist will call you when your order is ready.

Premium Service. This service is available only to NTIS Deposit Account customers. This service uses first class mail delivery (rather than fourth class) to expedite delivery. The surcharge is $3.50 for each copy ordered; for example, if you order three copies of one report or one copy each of three reports, the surcharge in either case would be $10.50. All Deposit Account customers receive a Premium Service ID number that they can use to place telephone orders, using a Western Union 24-hour toll-free number.

Rush Handling. NTIS fills these orders within eight working hours of receipt; no mail orders for rush handling are accepted. Your order can be placed using NTIS's toll-free number (800-336-4700), or by telegram, by Telex (89-9405), by Telecopier (703-32l-8547); or in person at one of NTIS's sales desks. Orders for mail delivery (by First Class Special Delivery) are accepted only from customers having NTIS Deposit Accounts, American Express, Master Card, or Visa accounts; the surcharge is $10 for each copy ordered. If the order is for personal pickup at one of NTIS's sales desks, the surcharge is $6 for each copy ordered. This service guarantees that your order receives immediate validation, verification of availability, and individual hand processing through inventory control and the warehouse, and priority printing if reproduction from film is required.

Ordering From Outside the U.S. To better serve overseas clients NTIS has more than 30 organizations around the world which provide local access to NTIS products and services. These agencies are equiped to handle all inquiries concerning services provided by NTIS. For a list of these agencies, please refer to the inside back cover.

HOW TO USE GOVERNMENT REPORTS ANNOUNCEMENTS & INDEXES

NTIS®

Arrangement Of Citations
Bibliographic entries in this journal are arranged by COSATI* classification. This scheme uses 22 broad subject categories which are further separated into 178 subcategories. A bibliographic record is listed in one subcategory only. There are no cross references except in the indexes. Within a subcategory, entries are listed alphanumerically by the NTIS order number.

Access Points
There are several ways to determine where a particular topic or citation is in GRA&I. The titles of the broad subject categories are listed on the back cover with an edge index to the journal location. Also, subject category and subcategory titles are used as running heads on each page of the Reports Announcement section of the journal. Specific citations can be located by searching the indexes by keyword, personal author name, corporate author name, contract number, grant number, report number or NTIS order number. The page number of the main entry in the Reports Announcement section is given with each index entry.

* Committee on Scientific and Technical Information

NTIS SUBJECT CATEGORY AND SUBCATEGORY STRUCTURE

NTIS®

You can use the Edge Index on the outside back cover to locate the beginning of each category within the Reports Announcements section.

Category 1. Aeronautics

Subcategories: Aerodynamics; Aeronatuics; Aircraft; Aircraft Flight Control and Instrumentation; Air Facilities.

Category 2. Agriculture

Subcategories:Agricultural Chemistry; Agricultural Economics; Agricultural Engineering; Agronomy and Horticulture; Animal Husbandry; Forestry.

Category 3. Astronomy and Astrophysics

Subcategories: Astronomy; Astrophysics; Celestial Mechanics.

Category 4. Atmoshpheric Sciences

Subcategories: Atmospheric Physics; Meteorology.

Category 5. Behavioral and Social Sciences

Subcategories: Administration and Management; Documentation and Information Technology; Economics; History, Law and Political Science; Human Factors Engineering; Humanities; Linguistics; Man-machine Relations; Personnel Selection, Training and Evaluation; Psychology (Individual and Group Behavior); Sociology.

Category 6. Biological and Medical Sciences

Subcategories: Biochemistry; Bioengineering; Biology; Bionics; Clinical Medicine; Environmental Biology; Escape, Rescue, and Survival; Food, Hygiene, and Sanitation; Industrial (Occupational) Medicine; Life Support; Medical and Hospital Equipment; Microbiology; Personnel Selection and Maintenance (Medical); Pharmacology; Physiology; Protective Equipment; Radiobiology; Stress Physiology; Toxicology; Weapon Effects.

Category 7. Chemistry

Subcategories: Chemical Engineering; Inorganic Chemistry; Organic Chemistry; Physical Chemistry, Radio and Radiation Chemistry.

Category 8. Earth Sciences and Oceanography

Subcategories: Biological Oceanography; Cartography; Dynamic Oceanography; Geochemistry; Geodesy; Geography; Geology and Mineralogy; Hydrology and Limnology; Mining Engineering; Physical Oceanography; Seismology; Snow, Ice, and Permafrost; Soil Mechanics; Terrestrial Magnetism.

Category 9. Electronics and Electrical Engineering

Subcategories: Components; Computer; Electronic and Electrical Engineering; Information Theory; Subsystems; and Telemetry.

Category 10. Energy Conversion (Non-propulsive)

Subcategories: Conversion Techniques; Power Sources; Energy Storage.

Category 11. Materials

Subcategories: Adhesives and Seals; Ceramics, Refractories,and Glasses; Coatings, Colorants, and Finishes; Composite Materials; Fibers and Textiles; Metallurgy and Metallography; Miscellaneous Materials; Oils, Lubricants, and Hydraulic Fluids; Plastics; Rubbers; Solvents, Cleaners, and Abrasives; Wood and Paper Products.

Category 12. Mathematical Sciences

Subcategories: Mathematics and Statistics; Operations Research.

Category 13. Mechanical, Industrial, Civil, and Marine Engineering

Subcategories: Air Conditioning, Heating, Lighting, and Ventilation; Civil Engineering; Construction Equipment, Materials, and Supplies; Containers and Packaging; Couplings, Fittings, Fasteners, and Joints; Ground Transportation Equipment; Hydraulic and Pneumatic Equipment; industrial Processes; Machinery and Tools; Marine Engineering; Pumps, Filters, Pipes, Fittings, Tubing, and Valves; Safety Engineering; Structural Engineering.

Category 14. Methods and Equipment

Subcategories: Cost Effectiveness; Laboratories, Test Facilities, and Test Equipment; Recording Devices; Reliability; Reprography.

Category 15. Military Sciences

Subcategories: Antisubmarine Warfare; Chemical, Biological, and Radiological Warfare; Defense; Intelligence; Logistics; Nuclear Warfare; Operations, Strategy, and Tactics.

Category 16. Missile Technology

Subcategories: Missile Launching and Ground Support; Missile Trajectories; Missile Warheads and Fuses; Missiles

Category 17. Navigation, Communications, Detection, and Countermeasures

Subcategories: Acoustic Detection; Communications; Direction Finding; Electromagnetic and Acoustic Countermeasures; Infrared and Ultraviolet Detection; Magnetic Detection; Navigation and Guidance; Optical Detection; Radar Detection; Seismic Detection.

Category 18. Nuclear Science and Technology

Subcategories: Fusion Devices (Thermonuclear); Isotopes; Nuclear Explosions; Nuclear Instrumentation; Nuclear Power Plants; Radiation Shielding and Protection; Radioactive Wastes and Fission Products; Radioactivity; Reactor Engineering and Operation; Reactor Materials; Reactor Physics; Reactors (Power); Reactors (Non-power); SNAP Technology.

Category 19. Ordnance

Subcategories: Ammunition, Explosives, and Pyrotechnics; Bombs; Combat Vehicles; Explosions, Ballistics, and Armor; Fire Control and Bombing Systems; Guns; Rockets; Underwater Ordnance.

Category 20. Physics

Subcategories: Acoustics; Crystallography; Electricity and Magnetism; Fluid Mechanics; Masers and Lasers; Optics; Particle Accelerators; Particle Physics; Plasma Physics; Quantum Theory; Solid Mechanics; Solid-state Physics; Thermodynamics; Wave Propagation.

Category 21. Propulsion and Fuels

Subcategories: Air-breathing Engines; Combustion and Ignition; Electric Propulsion; Fuels; Jet and Gas Turbine Engines; Nuclear Propulsion; Reciprocating Engines; Rocket Motors and Engines; Rocket Propellants.

Category 22. Space Technology

Subcategories: Astronautics; Spacecraft; Spacecraft Trajectories and Reentry; Spacecraft Launch Vehicles and Ground Support.

This categorization scheme is the one endorsed in 1964 by the Committee on Scientific & Technical Information (Cosati) of the Federal Council for Science & Technology. A booklet describing these categories is available from NTIS; the NTIS order number is AD-612 200, the price codes are PC AO4/MF AO1.

ABOUT ABSTRACT NEWSLETTERS

Abstract Newsletters announce in 27 subject categories summaries of most unclassified federally funded research as it is completed and made available to the public. Abstracts of reports appear in as many categories as appropriate, and do so within a few weeks of their receipt from the originating agencies. Generally, the technical report summaries have been prepared by the author. The final issue of the year is a subject index containing up to 10 subject postings and an NTIS Order/Report Number index. The titles of newsletters available on subscription are:

- Administration & Management
- Agriculture & Food
- Behavior & Society
- Biomedical Technology & Human Factors Engineering
- Building Industry Technology
- Business & Economics
- Chemistry
- Civil Engineering
- Communication
- Computers, Control, & Information Theory
- Electrotechnology
- Energy
- Environmental Pollution & Control
- Government Inventions for Licensing
- Health Planning & Health Services Research
- Industrial & Mechanical Engineering
- Information for Innovators (biweekly)
- Library & Information Sciences
- Materials Sciences
- Medicine & Biology
- NASA Earth Resources Survey Program (monthly)
- Natural Resources & Earth Sciences
- Ocean Technology & Engineering
- Physics
- Problem-Solving Information for State & Local Governments
- Transportation
- Urban & Regional Technology & Development

All are weekly publications except where noted. For a price list and sample copies please write to Subscriptions, NTIS, Springfield, VA 22161.

ABOUT SRIM

SRIM (Selected Research in Microfiche) is an automatic biweekly service available from NTIS to help you expand your coverage of U.S. Government research and development at a cost within reach of a modest information budget. You limit your expense by receiving complete research reports (not just abstracts) in microfiche, but only in the subject areas you select. You get the reports in microfiche without having to track down a specific report and order it. For full control of your SRIM collection, you can order the quarterly index service (cumulated annually). For further details, telephone SRIM information (703) 487-4640 or write to NTIS.

ABOUT PUBLISHED SEARCHES

Published Searches are bibliographies with abstracts prepared from the NTIS Bibliographic Data File of more than 680,000 reports, in anticipation of users' needs. Ask NTIS for a listing of Published Searches by requesting NTIS-PR-186. If your needs are more specialized and you want a custom online search, please call (703) 487-4642.

ABOUT PRODUCT FORMATS

Products listed in GRA&I are available in a variety of formats.
Paper copy (PC)—copies or reprints of the original report.
Microfiche (MF) - 105 x 148.57mm microfiche sheets (about 4 x 6 inches), 24X.
Microfilm - 16mm
Microfilm - 35mm
Magnetic tape - 7 - or 9-track recording modes

REPORTS ANNOUNCEMENTS

NTIS®

The full bibliographic report entries in this section are arranged by subject category and subcategory. Within each subcategory the reports are arranged alphanumerically by NTIS order number; the Ebcdic character set sort is used.

Computation of Hankel Transforms Using the Fast-Fourier Transform Algorithm,
E. Kausel, and G. Bouckovalas. Aug 79, 49p
R79-12, NSF/RA-79-12, NSF/RA-790206
Grant NSF-ENV77-18339

An efficient numerical procedure is presented for the computation of Hankel Transforms. The algorithm is based on the expression of the Hankel Transform in terms of a two-dimensional Fourier Transform, which is then reduced to only one dimension. The latter is then evaluated with the Fast Fourier Transform algorithm. Examples are presented, and a listing of the computer program included.

AD-A100 620/4 PC **A04**/MF **A01**
David W. Taylor Naval Ship Research and Development Center, Bethesda, MD.

An Integral Prediction Method for Three-Dimensional Turbulent Boundary Layers on Rotating Blades.
Research and development rept.,
Nancy C. Groves. Jun 81, 52p Rept no. DTNSRDC-81/050
Presented at Propellers 1981 Symposium, Virginia Beach, VA, 26-27 May 81.

A general formulation of the boundary-layer computation scheme on the surface of a rotating blade is presented. Momentum-integral methods, together with the three-dimensional entrainment equation for a rotating disk, are used to calculate the three-dimensional turbulent boundary layer in an orthogonal streamline coordinate system. First-order finite-difference methods are used to solve the resulting boundary-layer equations. The unknown variables are the streamwise momentum thickness, the shape parameter, and the streamline slope at the surface. The boundary-layer calculation method is combined with existing geometrical and inviscid potential-flow computer codes for rotating blades to form an efficient turbulent boundary-layer computer code. For a given potential-flow solution, a typical boundary-layer computation requires less than 10 seconds computer time on the Burroughs 7700 high-speed computer. Boundary-layer predictions are presented for several rotating blades. Computed results are shown to be in agreement with experimental data for a simple rotating body. For the examples considered, displacement of the mid-chord point of a blade from a straight radial line is predicted to reduce the computed values of local skin friction coefficient, with an estimated increase in overall efficiency of about one percentage point. (Author)

A Comparison of Various Techniques for the Prediction of Mass-Loaded Mode Shapes and Natural Frequencies.
Master's thesis,
Frank Broderick Atkinson. Mar 81, 130p Rept no. AFIT/GAE/AA/80D-1

The purpose of this investigation was to compare the results obtained from three modal prediction techniques. The first technique was an algorithm developed by Whaley for lightly damped structures (Method 1). Results using this algorithm were extracted from a thesis by Glenesk. The second method was the finite element method using NASTRAN (Method 2). The final method was the recovery of unloaded mass and stiffness matrices from the general matrix-vector differential equation of modal analysis using modal data obtained from an unloaded test item (Method 3).

The Numerical Solution of Incompressible Turbulent Flow Over Airfoils.
Doctoral thesis,
Harwood A. Hegna. Feb 81, 171p Rept no. AFIT/DS/AA/81-1

Numerical solutions are obtained for two-dimensional incompressible turbulent viscous flow over airfoils of arbitrary geometry. A body-fitted coordinate system is numerically transformed to a rectangular grid in the computational plane. The time dependent Reynolds averaged Navier-Stokes equations in the primitive variables of velocity and pressure are used. Turbulence is modelled with an algebraic eddy viscosity technique modified for separated adverse pressure gradient flows. The set of transformed partial differential equations is solved with an implicit finite difference method. Numerical solutions for a NACA 0012 airfoil near stall at a chord Reynolds number of 170,000 are favorably compared with surface pressure and velocity field measurements. A small laminar separation bubble near the suction pressure peak is observed. Computed lift and drag coefficients agree well with experimental values. (Author)

Combined Influence of Free-Stream Turbulence and Favorable Pressure Gradients on Boundary Layer Transition and Heat Transfer.
Interim rept. 1 Jun 80-31 Mar 81,
M. F. Blair, and M. J. Werle. Apr 81, 98p UTRC/R81-914388-17, AFOSR-TR-81-0517
Contract F49620-78-C-0064

Experimental research was conducted to examine the combined effects of free-stream turbulence and streamwise acceleration on transitional boundary layer flows. During this period convective heat transfer coefficients, boundary layer mean velocity and temperature profile data, and wall static pressure distribution data were obtained for four combinations of streamwise acceleration and free-stream turbulence intensity. Free-stream multi-component turbulence intensity, longitudinal integral length scale, and spectral distribution data were obtained for the four test cases. The profile results indicate that the data are accurate and consistent and that the experimental boundary layers were highly two-dimensional. The freestream turbulence distributions generated for these tests have been shown to be both homogeneous and nearly isotropic. It is anticipated that these results will provide a needed set of fundamental, well documented experimental test cases to which analytical predictions can be compared. Examinations of the transitional profile shape factors and wall heat transfer distribution data indicate that fully turbulent mean velocity profiles are achieved upstream of fully turbulent wall heat transfer rates. The present data suggest that the turbulent mean velocity profile is established in a shorter length than is required for the development of the equilibrium turbulence distribution. Transition location data obtained in the present program agree very well with data from other flat wall studies. Suggested correlation curves are given for predicting flat wall transition locations with the combined effects of free-stream turbulence and streamwise acceleration.

United Technologies Research Center, East Hartford, CT.
The Influence of Free-Stream Turbulence on the Zero Pressure Gradient Fully Turbulent Boundary Layer.
Interim rept. 1 Jun 78-1 Jun 80,
M. F. Blair, and M. J. Werle. Sep 80, 169p UTRC/R80-914388-12, AFOSR-TR-81-0514
Contract F49620-78-C-0064

Experimental research has been conducted to determine the influence of free-stream turbulence on zero pressure gradient fully turbulent boundary layer flow. During this period convective heat transfer coefficients, boundary layer mean velocity and temperature profile data, and wall static pressure distribution data were obtained for five flow conditions of constant free-stream velocity and free-stream turbulence intensities ranging from approximately 1/4% to 7%. Free-stream multi-component turbulence intensity, longitudinal integral scale, and spectral distributions were obtained for the various turbulence levels. The test results with 1/4% free-stream turbulence indicate that these data are in excellent agreement with classic two-dimensional low free-stream turbulence, turbulent boundary layer correlations, thus establishing the absolute accuracy of the experiment. The data obtained for the test cases with higher free-stream turbulence indicate that the turbulence has a significant effect on turbulent boundary layer skin friction and heat transfer. It has been shown that these effects are a function of the free-stream turbulence intensity, the turbulence length scale, and the boundary layer momentum thickness Reynolds number. Suggested correlations for the influence of free-stream turbulence on skin friction, heat transfer, and Reynolds analogy factor are given. Also during this period, a boundary layer prediction method has been assessed as to its ability to predict free-stream turbulence effects on flat plate heating and skin friction. Comparisons with the experimental data obtained here showed that adequate predictions can be made for this case with an existing turbulence model. (Author)

Viscous-Inviscid Interaction in Transonic Flow.
Doctoral thesis,
Laurence Byron Wigton. Jun 81, 115p AFOSR-TR-81-0538
Grant AFOSR-80-0230

The aim of this thesis is to couple an inviscid two dimensional steady transonic flow calculation with a boundary layer calculation. This interaction is especially important in transonic problems since the boundary layer has a significant effect on the inviscid portion of the flow. Here, the inviscid solution is obtained by an algorithm developed for the full potential equation by Holst and Ballhaus while the attached and separated turbulent boundary layer calculations are performed by Green's lag entrainment method. Guided by a model problem suggested by Le Balleur, a viscous-inviscid coupling algorithm is developed. Theoretical analysis indicates that it coverages rapidly for attached flows ad also performs well for separated flows. These conclusions are confirmed through a series of challenging transonic calculations involving both attached and separated flows. The coupling algorithm is remarkably stable and allows computation of coupled viscous-inviscid flows within times required to perform the inviscid calculations by themselves. (Author)

National Research Council, Washington, DC. Panel on the Public Policy Implications of Earthquake Prediction.
Nasa's Role in Aeronautics: A Workshop. Volume 1: Summary.
1981, 71p NASA-CR-164513
Contracts NASW-3455, NASW-2342
Workshop Held at Woods Hole, Mass., 27 Jul. - 2 Aug. 1980.

The state of the U.S. aeronautic industry and progressive changes in national priorities as reflected in federal unified budget outlays are reviewed as well as the contribution of NACA and the character and substance of U.S. aeronautical research under NASA. Eight possible roles for the future defined by NASA are examined and the extent to which the agency should carry out these activities is considered. The roles include: (1) national facilities expertise; (2) flight sciences research; (3) generic technology evolution; (4) vehicle class evolution; (5) technology demonstration; (6) prototype development; (7) technology validation; and (8) operations feasibility; How NASA's roles varies in the areas of military aviation, general aviation, transport aircraft aeronautics, rotorcraft aeronautics, engineering education, information dissemination, and cooperation with other organizations and agencies is discussed with regard to research in aerodynamics; structures and materials; propulsion; electronics and avionics; vehicle operations; and human engineering.

Workshop Held in Woods Hole, Mass., 27 Jul. - 2 Aug. 1980.

While the National Aeronautics and Space Act of 1958 makes DOD primarily responsible for military aeronautics, it stipulates a role for NASA in providing direct and indirect support for national defense. The existing role of NASA in support of military aeronautics is working well and is well coordinated. The role needs only to be kept effective and then improved by increasing its responsiveness to changing military requirements and by the selective application of additional people. Funding resources should also be made available to NASA for research. Specific roles that NASA could or

should play were examined. It was determined that the most important areas for this support are in basic research, generic technology evolution, and facility support in the fields of aerodynamics, structures and materials, and propulsion.

Contracts NASW-3455, NASW-2342
Workshop Held at Woods Hole, Mass., 27 Jul. - 2 Aug. 1980.

Segments of the spectrum of research and development activities that clearly must be within the purview of NASA in order for U.S. transport aircraft manufacturing and operating industries to succeed and to continue to make important contributions to the nation's wellbeing were examined. National facilities and expertise; basic research, and the evolution of generic and vehicle class technologies were determined to be the areas in which NASA has an essential role in transport aircraft aeronautics.

Nasa's Role in Aeronautics: A Workshop. Volume 4: General Aviation.
1981, 36p NASA-CR-164516
Contracts NASW-3455, NASW-2342
Workshop Held at Woods Hole, Mass., 27 Jul. - 2 Aug. 1980.

A substantially improved flow of new technology is imperative if the general aviation industry is to maintain a strong world position. Although NASA is the most eminently suited entity available to carry out the necessary research and technology development effort because of its facilities, expertise, and endorsement by the aircraft industry, less than 3% of its aeronautical R&T budget is devoted to general aviation aeronautics. It is recommended that (1) a technology program, particularly one that focuses on improving fuel efficienty and safety, be aggressively pursued by NASA; (2) NASA be assigned the role of leading basic research technology effort in general aviation up through technology demonstration; (3) a strategic plan be developed by NASA, in cooperation with the industry, and implemented in time for the 1982 budget cycle; and (4) a NASA R&T budget be allocated for general aviation adequate to support the proposed plan.

Contracts NASW-3455, NASW-2342
Workshop Held at Woods Hole, Mass., 27 Jul. - 2 Aug. 1980.

The potential roles for NASA relating to rotorcraft are reviewed. The agency's participation is delineated for each role, a rationale is provided, the current level of activity is summarized, and suggestions are given for the kinds of research still needed. In examining opportuntites for the most beneficial deployment of its resources, NASA should consider societal benefits as well as the military and civil markets in formulating the role it can play to support the development of a stronger rotorcraft technology base.

Contracts NASW-3455, NASW-2342
Workshop Held at Woods Hole, Mass. 27 Jul. - 2 Aug. 1980.

While each aspect of its aeronautical technology program is important to the current preeminence of the United States in aeronautics, the most essential contributions of NASA derive from its research. Successes and challenges in NASA's efforts to improve civil and military aviation are discussed for the following areas: turbulence, noise, supercritical aerodynamics, computational aerodynamics, fuels, high temperature materials, composite materials, single crystal components, powder metallurgy, and flight controls. Spin offs to engineering and other sciences explored include NASTRAN, lubricants, and composites.

Strake/delta Wing Interactions at High Angles of Attack.
M. I. G. Bloor, and R. A. Evans. Apr 80, 36p
NASA-CR-166183, SU-JIAA-TR-30
Contract NCC2-55

The method of vortex discretization is used to analyze the interaction of the vorticity generated by a strake, with the flow over a delta wing. The validity of the approach is first established by making comparisons with established methods for dealing with delta wings, after which compound delta planforms are discussed. An understanding of the favorable interference effects normally associated with this type of configuration is obtained and results are presented to quantify the expected lift increments resulting from the strake interaction.

Flag-Lag-Torsional Dynamics of Extensional and Inextensional Rotor Blades in Hover and in Forward Flight.
Semiannual Progress Report, Jan. - Jun. 1981.
M. R. M. Crespodasilva. Jun 81, 3p NASA-CR-164475
Contract NAG2-38

The formulation of differential equations of motion for both extensional and inextensional rotor blades, and the effect of cubic nonlinearities was examined. The developed differential equations are reduced to a set of three integro partial differential equations for a hingeless blade by eliminating the extension variable. Aerodynamic forces are modelled using Greenberg's extension of Theodorsen's strip theory. Equations of motion are expanded into polynomial nonlinearities to evaluate the motion of the system.

Application of Constrained Optimization to Active Control of Aeroelastic Response.
J. R. Newsom, and V. Mukhopadhyay. Jun 81, 15p NASA-TM-83150
Presented at the Joint Automatic Control Conf., Charlottesville, VA., 18-19 Jun. 1981.

Active control of aeroelastic response is a complex in which the designer usually tries to satisfy many criteria which are often conflicting. To further complicate the design problem, the state space equations describing this type of control problem are usually of high order, involving a large number of states to represent the flexible structure and unsteady aerodynamics. Control laws based on the standard Linear-Quadratic-Gaussian (LQG) method are of the same high order as the aeroelastic plant. To overcome this disadvantage of the LQG mode, an approach developed for designing low order optimal control laws which uses a nonlinear programming algorithm to search for the values of the control law variables that minimize a composite performance index, was extended to the constrained optimization problem. The method involves searching for the values of the control law variables that minimize a basic performance index while satisfying several inequality constraints that describe the design criteria. The method is applied to gust load alleviation of a drone aircraft.

Qualitative Comparison of Calculated Turbulence Responses with Wind-Tunnel Measurements for a DC-10 Derivative Wing with an Active Control System.
B. Perry, Iii. Jun 81, 13p NASA-TM-83144, AIAA-81-0567
Presented at the Aiaa Dyn. Specialist Conf., Atlanta, 8-11 Apr. 1981.

Comparisons are presented analytically predicted and experimental turbulence responses of a wind tunnel model of a DC-10 derivative wing equipped with an active control system. The active control system was designed for the purpose of flutter suppression, but it had additional benefit of alleviating gust loads (wing bending moment) by about 25%. Comparisions of various wing responses are presented for variations in active control system parameters and tunnel speed. The analytical turbulence responses were obtained using DYLOFLEX, a computer program for dynamic loads analyses of flexible airplanes with active controls. In general, the analytical predictions agreed reasonably well with the experimental data.

The Effect of the Airline Deregulation Act on the Level of Air Safety. Annual Report of the Secretary of Transportation to the United States Congress Pursuant to Section 107 of the Airline Deregulation Act of 1978 (P.L. 95-504).
Jan 80, 102p

This report was prepared in response to the requirements of section 107 of the Airline Deregulation Act of 1978 (P.L. 95-504). It reviews the impact of deregulation on air carrier operations in calendar year 1979, with emphasis on the carriers extensively involved in scheduled domestic passenger service in the contiguous United States and statistically explores the accident, incident and vio-

lation records of these carriers. The statistical data from calendar year 1979 does not show that the level of air safety was adversely affected by deregulation. There were no accidents in which deregulation was determined to be a direct causal factor. The accident and fatal accident rates for certificated route carriers closely parallel those of previous years. Only the fatality number and rate, resulting from two accidents of wide-bodied jet aircraft, were higher. The commuter airline accident and fatal accident rates for 1979 remained comparably similar to the past 4 years of reported data, while the commuters experienced one of their highest traffic growth rates as a result of the stimulus provided by deregulation. Optimization of Strategic Airlift in-flight Refueling.
Master's thesis,
Vernon P. Bordelon, Jr., and John C. Marcotte, Jr. Mar 81, 214p Rept no. AFIT/GST/OS/81M-3

During the 1980s increases in the potential use of Strategic Airlift to transport equipment and personnel is anticipated. The capabilities of Strategic Airlift aircraft are extended through the inclusion of efficient in-flight refueling. The primary objective of this research was to develop a method which determines the combination of in-flight refueling rendezvous point, takeoff fuel loads and tanker base which results in the minimum total fuel consumption for an airlifter and tanker aircraft. The experimental design included the creation of two models. An analytic flight planning model determined the optimal rendezvous point and the takeoff fuel loads for the aircraft in a specific mission scenario. A SLAM simulation model verified the operational feasibility of the results of the analytic model by simulating the flights of aircraft.

Aircraft Accident Report - Continental Airlines/ Air Micronesia, Inc. Boeing 727-92C, N18479, Yap Airport, Yap, Western Caroline Islands, November 21, 1980.
27 May 81, 52p NTSB-AAR-81-7
Paper copy also available on subscription, North American Continent price $50.00/year; all others write for quote.

At 0952 local time, on November 21, 1980, Continental Airlines/Air Micronesia, Inc., Flight 614, a Boeing 727-92C, N18479, crashed while attempting to land on runway 7 at Yap Airport, Yap, Western Caroline Islands. The aircraft touched down 13 feet short of the runway and the right main landing gear immediately separated from the aircraft. The aircraft gradually veered off the runway and came to rest in the jungle about 1,700 feet beyond the initial touchdown. Fire erupted along the right side of the aircraft as it came to a stop. All 73 occupants (67 passengers and 6 crewmembers) escaped before fire destroyed the aircraft. Three persons received serious injuries; the remainder received minor or no injuries.

Helicopter Noise Exposure Level Data: Variations with Test Target. Indicated Airspeed, Distance, Main Rotor RPM and Takeoff Power,
J. Steven Newman. 10 Jul 80, 37p Rept no. FAA-AEE-80-34

This report provides uncorrected noise exposure level data measured using an integrating sound level meter at a single measurement location during the recently completed, week long, FAA helicopter noise test. In addition to the measurements reported, primary acoustical measurements were conducted. This acoustical data (acquired for nine microphones) will be combined with flight path track data processed at the FAA, Dulles Noise Laboratory by D. W. Ford. Meteorological data acquired from surface readings and radiosondes will be processed by U.S. Weather Service personnel.

Interpolating Subroutine for High Power System Design.
Master's thesis,
Gerald D. Clark. Dec 80, 64p Rept no. AFIT/GE/EE/80D-14

The Aero Propulsion Laboratory is currently developing a computer-aided design program for high power airborne systems. An important part of this design program will be the feasibility study which was to be based on summary algorithms. These algorithms were to relate the weight and volume of each system component to the contributing operating parameters. This study first centers on the requirements for an interpolation scheme to form the summary algorithms. The scheme will need to work in at least four dimensions and produce accurate results over wide ranges. The advantages of the two possible interpolation approaches (algorithm development and direct interpolation) are described. The results of this comparison show clear advantages in the direct interpolation approach using stored data. The remainder of this study is a description and evaluation of the subroutine which was developed, INTERP. It has the flexibility to interpolate a data array with two or more independent variables and will output the values of any number of dependent variables. The routine also compensates for missing values in the known data array and issues an error message to the user when a test point beyond the data range is input. (Author)

Direct Digital Design Method for Reconfigurable Multivariable Control Laws for the A-7D Digitac II Aircraft.
Master's thesis,
David W. Potts. Dec 80, 144p Rept no. AFIT/GE/EE/80D-36

This thesis investigates control of an aircraft when there is a primary control surface failure. The object of this study is to reconfigure the remaining control surfaces to compensate for the additional forces and moments generated by the inoperative control surface. To study this flight control problem, a comprehensive aircraft model is required which considers each control surface operating individually. A six degree-of-freedom aircraft model is developed, including all the individual control surfaces. A control surface input can produce both a lateral and/or a longitudinal response. Thus, the equations of motion cannot be decoupled for the design of the control laws. The coupling between the axes requires the derivation of several new non-dimensional control derivatives. Using the geometrical properties of the aircraft and the Digital Datcom computer program, the needed control derivatives are derived. The entire eigenstructure assignment method is used to assign both the eigenvalues and the eigenvectors to the closed-loop plant matrix. This method is used for the direct digital design of a multivariable discrete regulator and tracker control law. The effect of increasing the number of control inputs on the relative degree of controllability of the states was determined by singular value decomposition.

Payne, Inc., Annapolis, MD.
Wind Tunnel Measurements of Total Force and Extremity Flail Potential Forces on a Crew Member in Close Proximity to a Cockpit.
Final rept. Jun 77-Feb 80,
Harold L. Newhouse, Peter R. Payne, and James P. Brown. Dec 80, 90p AMRL-TR-79-110
Contract F33615-77-C-0523

In order to determine the aerodynamic forces acting upon a crewmember/escape seat combination at transonic speeds, and the flail potential forces acting on the crewmember's extremities, an existing half scale man/seat combination was integrated with a model of the forward portion of the F-16. The combination was tested in the Arnold Engineering Development Center Propulsion Wind Tunnel (PWT) Facility Transonic Wind Tunnel (16T) during the period September 9 to September 15, 1978, over the Mach number range 0.4 to 1.2. The basic data obtained in this way are reported in Reichenau. The present report describes the experimental set-up in detail and presents some typical force and force area (force/sq. q) plots. From earlier work it was determined that the flow over the model was 'supercritical', implying a turbulent boundary layer at separation, and a reasonably realistic simulation of full-scale conditions. Very marked interference effects were observed on the man/seat combination, due to fuselage proximity. The most dramatic were large increases in upper arm and upper leg flail potential forces. In almost all cases, the most severe interference occurred when a 'flow diverter' was mounted in front of the cockpit. Comparisons with other sources of data revealed generally good agreement, except that the drag of the model was somewhat low; presumably due to the fact that the model was smoother than its full scale equivalent. AH-1S(PROD) Airworthiness and Flight Characteristics for Instrument Flight.
Final rept. May-Aug 80,
John S. Tulloch, John D. Ottomeyer, Charles E. Frankenberger, Jr., and Bartholomew d. Picasso, III. Nov 80, 47p Rept no. USAAEFA-79-08

The United States Army Aviation Engineering Flight Activity conducted an Airworthiness and Instrument Flight Characteristics evaluation of a Production AH-1S (Prod) to determine potential for the AH-1S with Enhanced Cobra Armament System (ECAS) to meet instrument meteorological conditions qualification criteria. The test aircraft was configured with two tube launched, optically tracked, wireguided (TOW) missile launchers on each outboard wing stores station and a 7-tube lightweight launcher on each inboard wing stores station. The test consisted of 16.3 flight hours which were flown during 12 test flights. Four deficiencies and seven shortcomings associated with flying the AH-1S in instrument flight conditions, were identified. The deficiencies identified were: (1) Unsatisfactory cyclic control system mechanical characteristics; (2) large pitot-static system airspeed errors in climb and descent; (3) Easily excited lateral gust response; (4) Vertigo-inducing location of radio control panels. Five specification noncompliances were noted. The AH-1S (Prod) is not suitable for flight in instrument meteorological conditions, which infers tht the AH-1S (ECAS) will also not be suitable. Quantifying Reactive Maneuvers.
Master's thesis,
John J. Alt. Mar 81, 221p Rept no. AFIT/GST/OS/81M-1

There is currently no value of survivability attributed to an aircraft's reactive maneuver capability. In this experiment, exposure to enemy ground threats for various levels of information feedback to the aircrew were compared. This was done in an attempt to isolate the maneuverability factor. The Threat Model Penetration Simulation Analysis (TMPSA) model produced by the University of Dayton Research Institute was the penetration model used. The conclusion of this experiment was that only order of magnitude differences in capabilities can be captured with this model. It is recommended that two simple changes be made to TMPSA. These changes would allow more precise values for reactive maneuvers to be derived. (Author)

Survivability Study of a FLIR Equipped Fighter on a Night Penetration of a Soviet Army.
Master's thesis,
Warren J. Leek, and Richard W. Schmitt. Mar 81, 161p Rept no. AFIT/GST/OS/81M-9

The LANTIRN system provides the fighter pilot with a forward looking infrared (FLIR) system, which allows him to fly the aircraft lower and faster than he would otherwise be able to fly. The objective of this research effort was to determine whether this increased capability will significantly improve the fighter's survivability in the night interdiction role. The problem was studied in the context of the threats and terrain found in the central region of West Germany. A model of the terrain features and threat scenario was constructed using the SLAM computer simulation language. The Soviet defensive systems can be moved around as desired, and aircraft can enter the system at a variety of arrival intervals, airspeeds, and altitudes. Defensive systems that are within range of the aircraft will shoot at it, provided they are not tied up with a previous aircraft, blocked by terrain, or prevented from shooting because of a low probability of kill. The capability to fly faster did not significantly increase the fighter's survivability. A decrease in altitude from 1000 feet to 500 feet increased survivability to a minor degree, while a further decrease to 250 feet improved survivability significantly. These findings led to the conclusion that a strong effort should be made to develop a FLIR of high enough resolution to allow the pilot to fly the mission at an altitude of 250 feet or below. Phase 2 and 3 Wind Tunnel Tests of the J-97 Powered, External Augmentor V/STOL Model.
D. B. Garland. Oct 80, 148p NASA-CR-152380, DHC-DND-80-1
Contract NASW-2797

Modifications were made to the model to improve longitudinal acceleration capability during transition from hovering to wing borne flight. A rearward deflection of the fuselage augmentor thrust vector is shown to be beneficial in this regard. Other agmentor modifications were tested, notably the removal of both endplates, which improved acceleration performance at the higher transition speeds. The model tests again demonstrated minimal interference of the fuselage augmentor on aerodynamic lift. A flapped canard surface also shows negligible influence on the performance of the wing and of the fuselage augmentor.

Flap-Lag-Torsional Dynamic Modelling of Rotor Blades in Hover and in Forward Flight, Including the Effect of Cubic Nonlinearities.
M. R. M. Crespodasilva. Jul 81, 73p NASA-CR-166194, ASD-81-6-1
Contract NAG2-38

The differential equations of motion, and boundary conditions, describing the flap-lead/lag-torsional motion of a flexible rotor blade with a precone angle and a variable pitch angle, which incorporates a pretwist, are derived via Hamilton's principle. The meaning of inextensionality is discussed. The equations are reduced to a set of three integro partial differential equations by elimination of the extension variable. The generalized aerodynamic forces are modelled using Greenberg's extension of Theodorsen's strip theory. The equations of motion are systematically expanded into polynomial nonlinearities with the objective of retaining all terms up to third degree. The blade is modeled as a long, slender, of isotropic Hookean materials. Offsets from the blade's elastic axis through its shear center and the axes for the mass, area and aerodynamic centers, radial nonuniformaties of the blade's stiffnesses and cross section properties are considered and the effect of warp of the cross section is included in the formulation.

Subsonic Tests of an All-Flush-Pressure-Orifice Air Data System.
T. J. Larson, and P. M. Siemers, III. Jun 81, 50p NASA-TP-1871, H-1122
Presented at the 1980 Air Data Systems Conf., Colorado Springs, May 1980.

The use of an all-flush-pressure-orifice array as a subsonic air data system was evaluated in flight and wind tunnel tests. Two orifice configurations were investigated. Both used orifices arranged in a cruciform pattern on the airplane nose. One configuration also used orifices on the sides of the fuselage for a source of static pressure. The all-nose-orifice configuration was similar to the shuttle entry air data system (SEADS). The flight data were obtained with a KC-135A airplane. The wind tunnel data were acquired with a 0.035-scale model of the KC-135A airplane. With proper calibration, several orifices on the vertical centerline of the vehicle's nose were found to be satisfactory for the determination of total pressure and angle of attack. Angle of sideslip could be accurately determined from pressure measurements made on the horizontal centerline of the aircraft. Orifice pairs were also found that provided pressure ratio relationships suitable for the determination of Mach number. The accuracy that can be expected for the air data determined with SEADS during subsonic orbiter flight is indicated.

Overview of Langley Activities in Active Controls Research.
I. Abel, and J. R. Newsom. Jun 81, 21p NASA-TM-83149
Presented at the Joint Automatic Control Conf., Charlottesville, MD., 18-19 Jun. 1981.

The application of active controls technology to reduce aeroelastic response of aircraft structures offers a potential for significant payoffs in terms of aerodynamic efficiency and weight savings. The activities of the Langley Research Center (laRC) in advancing active controls technology. Activities are categorized into the development of appropriate analysis tools, control law synthesis methodology, and experimental investigations aimed at verifying both analysis and synthesis methodology.

Static Tests of Excess Ground Attenuation at Wallops Flight Center.
Final Report.
L. C. Sutherland, and R. Brown. Jun 81, 155p
NASA-CR-3435, WR-80-32
Contract NAS1-15845

An extensive experimental measurement program which evaluated the attenuation of sound for close to horizontal propagation over the ground was designed to replicate, under static conditions, results of the flight measurements carried out earlier by NASA at the same site (Wallops Flight Center). The program consisted of a total of 41 measurement runs of attenuation, in excess of spreading and air absorption losses, for one third octave bands over a frequency range of 50 to 4000 Hz. Each run consisted of measurements at 10 locations up to 675 m, from a source located at nominal elevations of 2.5, or 10 m over either a grassy surface or an adjacent asphalt concrete runway surface. The tests provided a total of over 8100 measurements of attenuation under conditions of low wind speed averaging about 1 m/s and, for most of the tests, a slightly positive temperature gradient, averaging about 0.3 C/m from 1.2 to 7 m. The results of the measurements are expected to provide useful experimental background for the further development of prediction models of near grazing incidence sound propagation losses.

Rotary Latch.
Patent Application,
Kenneth W. Rosenberg. Filed 15 Dec 80, 8p AD-D008 544/9
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

This invention describes a rotary latch having drive mean rotatably mounted in a housing, said drive means having a semi-circular hooked-shaped latch arm thereon. A cover is attached to said housing and an axially mounted, spring-biased shaft is concentrically mounted within said drive means and has locking lugs engageable with said drive means and said cover. In one axial position of said center shaft, said drive mean is locked against rotation and, in another axial position the drive means in unlocked and free to rotate. A stop is provided on said drive means and is engageable with said housing to limit rotation of latch arm.

Flight Control System Analysis and Design for a Remotely Piloted Vehicle with Thrust Vectoring Unit.
Master's thesis,
Brian Leigh Jones. Dec 80, 155p Rept no. AFIT/GAE/AA/80D-12

This study investigated the stability and control of a remotely piloted vehicle (RPV) with a thrust vectoring unit attached. All geometric and aerodynamic data was generated and used to analyze the RPV. Specific handling qualities were developed and compared with the RPV characteristics. This comparison indicated that the RPV was too oscillatory in both the phugoid and dutch roll modes. Also, the RPV displayed a dominant spiral mode. A flight control system was synthesized to eliminate these traits. Evaluation of this flight control system was conducted through the use of three different sensitivity studies and a nonlinear simulation. In addition, a model matching application was examined for this RPV. Model matching entails using design procedures to synthesize an expanded flight control system so that the RPV has dynamic characteristics similar to the F-15. (Author)

Additions to Cropland, 1975-77: A Report on a Landownership Follow-On Survey.
Arthur B. Daugherty. May 81, 27p AGESS-810501

An estimated 9.1 million acres of land were converted to crop production by more than 220,000 landowners during the 1975-77 period. More than 60 percent of the new cropland was previously in pasture, grass, or rangeland. More than half the land had not been previously used for crop production. One third of the land was cleared of brush or trees prior to use as cropland. More than 85 percent of the owners indicated that about 85 percent of the land would continue in crop production in the future.

Price Spreads and Cost Components for Broilers and Eggs.
Staff rept.,
Kenneth Blase. Jan 81, 21p AGESS-810119

Price spreads for broilers and eggs remained relatively stable from 1960 through 1970, then rose steadily from 1970 to 1979. The cost of performing almost every marketing service increased from 1970 to 1979 with labor, energy, and packaging contributing heavily to the increased costs. Cost components were introduced in 1972 as another method of identifying the reasons for increasing marketing costs. Although marketing costs of broilers and eggs have increased, structual changes in the industry (almost complete integration for broilers and increasing integration for egg production) and the resulting efficiencies throughout the production and marketing system have held the increases to a minimum compared with other foods; thus, broilers and eggs have consistently been good buys.

Agricultural Structures Policy in the European Economic Community.
Staff rept.,
Edmund Neville-Rolfe. May 81, 162p AGESS-810522

The study summarizes and discusses agricultural structural policies enacted by the European Economic Community, the application of Community measures in each member country, and the National measures of each member country. Although original intentions were to spend a large proportion of the EEC's agricultural budget on farm structure, cost escalations in commodity price support programs, storage costs, and surplus disposal schemes resulted in niggardly Community funding for agricultural structural improvements. While some member countries have a strong viable program of farm restructuring drawing on both national and Community funding (e.g., The Netherlands), others are at a much lower level of activity (e.g., Italy).

Aug 79, 43p AID-PN-AAH-362
Contract AID/ta-BMA-7
International Conference on Rural Finance Research Issues (2nd), Calgary, Canada, August 29-31, 1979.

The document contends that although these programs are economically oriented, agricultural development programs in LDCs are used as an instrument for consolidating political support. A model of the political economy of agricultural credit is examined and applied to Bolivia. Conclusions and policy implications are then drawn. The model demonstrates that under typical LDC conditions of direct government control of financial institutions, concessionary interest rates, defaulting, and inflation, credit is used for both economic and political reasons.

Grant AID/ta-BMA-7
Prepared for International Conference on Rural Finance Research Issues (2nd), Cagary, Canada, August 29-31, 1979.

Many LDCs have used rural credit as an incentive to promote investments in their agricultural sectors. Using examples from Brazil, this paper analyzes the effectiveness of these policies and their impact on income distribution. First, the institutional and economic environment of Brazil is outlined and then a model is presented through which rural credit is analyzed. Next, the impact of these credit programs on income distribution is discussed. Empirical evidence and a summary of results conclude this report.

New Lands Productivity in Egypt: Technical and Economic Feasibility,
L. F. Hesser, and E. Asmon. Jan 80, 235p AID-PN-AAH-511
Contract AID/NE-C-1645

Egypt has made heavy public investments in land reclamation during the past 25 years. The economic and social pressures that undergrid the emphasis on expanding the cultivated area are real and understandable. This reports states that a number of land reclamation opportunities with potentially attractive rates of return do exist if proper criteria is followed. Priority should be given to rehabilitating already reclaimed lands in areas where the required water lift is low.

Contract DI-14-34-0001-9028
Prepared in cooperation with Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.

Good water management requires that all available water in a stream-aquifer system be properly accounted for. In the semiarid West the major water demand is for agricultural irrigation. Significant portions of diverted irrigation water return to the stream. The amount and timing of irrigation return flow is difficult to quantify. The study's goals were (1) to identify the existing methodologies for return flow quantification, and (2) to suggest potential field sites that might be appropriate for field testing of the more promising methodologies.

Proceedings of the Consultants' Group Meetings on Downy Mildew and Ergot of Pearl Millet Held at Hyderabad, India on 1-3 October 1975,
R. J. Williams. 1 Oct 75, 139p

ICRISAT, the International Crops Research Institute for the Semi-Arid Tropics, was created to serve a large segment of humanity which has been left behind in modern advances in the sciences of agricultural production. Pearl millet is the major crop able to withstand the moisture stresses so common on the sandier and less moisture retentive soils and of the drier areas of the semi-arid tropics. But their susceptibility to downy mildew and ergot, when they are grown on an extensive scale, have proven to be the major obstacle to the realization of the high hopes aroused by these more productive genotypes. The report describes the problem and progress on this vital problem.

An Annotated Bibliography of Chickpea Diseases, 1915-1976.
Information bulletin no. 1,
Y. L. Nene, A. Mengistu, J. B. Sinclair, and D. J. Royse. 1978, 52p

Chickpea (Cicer arietinum) is a native Asian plant species grown as a pulse crop throughout tropical and subtropical Asia, northern Africa, southern Europe, Central America, and the southern United States. Its seeds are used directly as food, ground into flour, or used as ingredients in curries, soups, and salads. Gram, garbanzo bean, and Spanish pea are other names for the crop. ICRISAT, an international agricultural research institute established in India, has a world-wide mandate for chickpea improvement. It is pleased to be associated with this publication on chickpea diseases. The authors have worked together in an international effort to produce a bibliography annotating all the known literature on the diseases of the crop.

Indian Theses on Groundnut: A Bibliography, 1948-1977.
Information bulletin no. 4,
Shree Ram Yadav, S. Prasannalakshmi, and P. S. Jadhav. 1978, 54p

Groundnuts, as a food crop, contribute significantly to human diets in the Semi-Arid Tropics. World production of groundnuts is estimated to be an annual 18.5 million metric tons grown on an area of 19.3 million hectares (an average yield of 958 kg/ha in shell). More than 70 percent of the world production is grown in developing countries, and India produces more than 5 million metric tons from 7 million hectares. This bibliography is a compilation of M Sc and Ph D theses on groundnuts submitted to Indian universities and institutions prior to 1977.

Urban Lawn Irrigation and Management Practices for Water Saving with Minimum Effect on Lawn Quality.
Completion rept.,
Robert E. Danielson, Charles M. Feldhake, and William E. Hart. Apr 81, 130p COMPLETION-106, W81-03604, OWRT-A-043-COLO(2)
Contracts DI-14-34-0001-9006, DI-14-34-0001-0106

Understanding the response of turfgrass to water and energy is critical in semiarid regions where energy for evaporation is high and water is often in short supply. During the summers of 1979 and 1980 research was conducted at Colorado State University to help in planning efficient urban lawn irrigation techniques. Forty-eight small bucket-type weighing lysimeters were used to measure the effect of various management practices on maximum water use and the response of turf quality to limited irrigation levels. Maximum water use was influenced by mowing height, nitrogen fertility, shade level, grass specie, and to a slight degree, soil properties. Nitrogen-deficient grass showed a linear decrese in visual auality with decrease in irrigation; adequately fertilized grass, however, had minimal reduction in quality when irrigation was decreased.

Subjective Production Function Parameters and Risk: Wheat Production in Tunisia.
Staff paper,
Terry Roe, and David Nygaard. Dec 79, 17p P79-43, AID-PN-AAH-565
Contract AID/ta-BMA-5

It is maintained that, at the time of seed bed preparation for the production of durum wheat, Tunisian farmers form subjective estimates of the parameters of the underlying production function. If their estimates are not accurate, resources are not optimally allocated. If farmers behave as though their estimates are not known with certainty, they face risk. The problems become even more acute if these parameters vary in some complex manner, as in the case of wheat, with yearly weather, soil moisture, disease, and other soil and atmospheric conditions affecting plant growth. This paper explores these problems, by focusing on 125 farmers in Northern Tunisia during the 1976-77 crop year.

Intercropping in Traditional Farming Systems,
N. S. Jodha. 1979, 27p AID-PN-AAH-424
Grant AID/ta-G-1421

Though largely neglected by researchers and planners, intercropping is a key element of traditional farming systems. its superiority over sole cropping has been shown in terms of higher and dependable gross returns per hectare as well as per unit of peak period labor use. Its potential for greater employment is also revealed. Studies show that intercropping is largely a system of small and unirrigated farms.

One, Two, and Three Line Segment 'Straw Man' Models: Soybean Yields in Iowa, Illinois, and Indiana.
Staff rept.,
Jeanne L. Sebaugh. May 81, 66p AGESS-810514

All of the straw man models attempt to explain differences in yields over time by fitting trend lines to the yield data. The one line segment straw man model, simple linear regression, describes a uniform increase in yields over time. The two and three line segment straw man models allow the rate of change in yields to vary over the time period. The performance of the three models in predicting soybean yields in Iowa, Illinois, and Indiana is compared based on eight model characteristics.

The Processes of Desertification and the Choice of Intervention.
Progress rept. no. 2,
N. S. Jodha. Jun 79, 21p AID-PN-AAH-422
Grant AID/ta-G-1421

The arid zone of Rajasthan currently accounts for nearly 63% of the tropical arid areas in India, and is expanding. The deliberations of the UN Desertification Conference at Nairobi (1977) and subsequent follow-up actions at national and international levels clearly indicate the increasing concern about the problem. Viable solutions call for understanding of the cause manifested by the decisions and practices of the ultimate users of the land in the arid or desert areas. This paper examines the process of desertification in the arid zone of Rajasthan.

Evaluation of the Productivities of Maure and Peul Cattle Breeds at the Sahelian Station, Niono, Mali.
1978, 117p ILCA/MONO-1, AID-PN-AAG-756
Grant AID/ta-G-1497

From 1966 to 1975, the Sahelian Station at Niono, Mali, maintained substantial herds of two typical African breeds of Zebu cattle, the Maure and the Peul, together with their crosses, in order to collect comparative data in the areas noted below. This report is an analysis of these data performed by the International Livestock Center for Africa. The animals were kept for milk and meat production and for draft purposes. They were maintained by improved management practices such as supplementary feeding, controlled breeding, and veterinary care. An introduction describes the animal production system at Niono, together with the preparation of the data for analysis and the analytical method used. Appended is a 40-item bibliography of English, French, and German language report-related titles (1947-76).

Livestock Production in the Subhumid Zone of West Africa: A Regional Review.
1979, 191p ILCA/SYSTEMS STUDY-2, AID-PN-AAH-564
Grant AID-DSAN-G-0081

This report on livestock production in the subhumid zone of West Africa is based on the results of a symposium held in Kaduna, Nigeria in March 1979, co-sponsored by the International Livestock Centre for Africa and the National Animal Production Research Institute. A definition of the zone is given, followed by a brief description of the environment and the Fulani pastoralists who own most of the livestock. The fodder and animal resources of the zone are then described, followed by section on tsetse-transmitted trypanosomiasis and other animal diseases, and concluding with an analysis of land-use and development strategies.

Inventory of United States Forest Growth Models.
J. L. Trimble, and C. R. Shriner. Jun 81, 137p
ORNL/Sub-80/13819/1
Contract W-7405-ENG-26
Microfiche only after original copies are exhausted.

This document is an inventory of forest tree growth models that have been developed in the United States. The intent of this inventory is to provide documentation of existing growth models and to present the state-of-the-art in forest growth modeling. Analysis of the accuracy or usefulness of the models does not fall into the scope of this document. The growth models discussed are organized into the following categories: individual tree models; gap models; whole stand or forest models; diameter distribution models; and unclassified models. The information provided for each model includes a general description, geographic coverage, and general application(s). Additional information including availability, computer execution, documentation, and an abstract (when available) is provided to further describe the model. A contact person knowledgeable in the use and development of each model is provided. This inventory focuses on computerized models; however, mathematical models and yield tables are discussed. Large-Scale Color Aerial Photography as a Tool in Sampling for Mortality Rates.
Forest Service research paper.
David A. Hamilton. Jan 81, 14p FSRP/INT-269

Mortality rates specify the proportion of trees with a given set of characteristics that are expected to die in a fixed time interval. Results indicate that 1-year mortality trees can be dated and species can be assigned to green trees and to 1-year mortality trees with acceptable accuracy on 70 mm color photography at scales of 1:1600 and 1:2400. Attempts to date 2-year mortality trees on either scale photography were unsuccessful.

Forest Vegetation Removal and Slope Stability in the Idaho Batholith.
Forest Service research paper,
Donald H. Gray, and Walter F. Magahan. May 81, 28p FSRP/INT-271

The study gives results of field studies and supporting theoretical analyses show that forest vegetation often provides a significant margin of safety to the stability of slopes in the Idaho batholith. Woody vegetation contributes to the stability of these slopes by root reinforcement, by soil moisture depletion from interception and transpiration, by regulation of snow accumulation and melting, and by soil arching restraint between tree stems. Removal of vegetation by logging or fire can increase landslide risks at many locations.

Nitrogen Cycling and Assimilative Capacity of Nitrogen and Phosphorus by Riverine Wetland Forests,
Mark M. Brinson, H. David Bradshaw, and Emilie S. Kane. May 81, 108p UNC-WRRI-81-167, W81-03725, OWRT-B-114-NC(2)
Contract DI-14-34-001-8107
Prepared in cooperation with East Carolina Univ., Greenville, NC. Dept. of Biology.

Labeled (15N) nitrate and ammonium were added to swamp surface water and their diffusion to the forest floor was followed. Of the original nitrate added, 46% remained in the surface water of Tar Swamp and 62% in Creeping Swamp after 2 days. Two days after ammonium treatments, corresponding levels were 79% and 81%. As indicated by the absence of recoverable 15N in sediments following nitrate treatments, diffusion of labeled nitrate to the forest floor resulted in its transformation to N2O or N2 by denitrification. Available nitrogen reserves in the sediments were depleted through ammonification and nitrification during annual drydown episodes, and the capacity for additional nitrogen assimilation by the sediments was renewed. An experiment was then conducted to determine the capacity of sediments for sustained nutrient assimilation by adding nitrate, ammonium, phosphate, and secondarily treated sewage effluent to surface water in separate chambers at weekly intervals for 46 weeks.

Evaluation of Veneer Yields and Grades from Yellow-Poplar, White Oak, and Sweetgum from the Southeast: COM-PLY Report-19.
Forest service research paper,
Robert H. McAlister. Apr 81, 16p FSRP-SE-220, SEFES-81-15
Sponsored in part by the Department of Housing and Urban Development, Washington, DC. Div. of Energy, Building Technology and Standards.

The dry volume yield and standard grades of veneer are given for yellow-poplar, sweetgum, and white oak by tree diameter and location within the stem. Manufacture of composite structural lumber and panels can effectively utilize available hardwood stands. The lower 26 feet of the stem of trees 16 inches d.b.h. and smaller yield a high proportion of grade C and better veneer that is desirable for COM-PLY lumber, while veneer of all grades can be used for the panels, and the particleboard cores can be made from both forest and mill residues. Although the total veneer yield from hardwoods is generally less than that from loblolly and slash pines, typical stands of mixed southern pine and hardwood timber yield.

A Study of Interstellar Carbonyl Sulfide.
Paul F. Goldsmith, and Richard A. Linke. 23 Sep 80, 40p
Contract N00014-76-C-0070, Grant NSF-GP-30424

We have carried out a study of the carbonyl sulfide (OCS) molecule in 24 interstellar and circumstellar molecular clouds, and detected it in a total of 10 sources and 7 different transitions. Analysis of the data using hydrogen densities derived from a study of CS (Linke and Goldsmith 1980), and assuming that the OCS lines are optically thin, yields a mean column density <N(OCS)> = 3 x 10 to the 14th power/sq cm in ten interstellar clouds while the average fractional abundance <N(OCS)/N(H2)> = 1.6 x 10 to the minus 9th power, consistent with the theoretical prediction of Oppenheimer and Dalgarno (1974). The results of maps and analysis of multiple transitions in several sources suggest that the regions responsible for the OCS emission are only marginally resolved with a beamsize of approx. 2'. Direct measurements yield (OCS/O13CS) = 21 and (OCS/OC34S) = 16 in SGR B2, compared to terrestrial values of 89 and 23, respectively. (Author)

17. international cosmic ray conference, Paris, France, 13 Jul 1981.

The theoretical basis for the supernova envelope shock origin of cosmic rays is reviewed. The theoretical explanation of the SN Type I light curve requires the ejection of a relativistic mass fraction. The criterion of the adiabatic deceleration by Alfven wave trapping neither applies in theory, when beta > 1, or practice, the Starfish high altitude nuclear explosion experiment. Arguments of delayed acceleration due to K-capture are not applicable to SN ejecta because a period of prompt recombination exists before subsequent stripping in propagation. (ERA citation 06:022739)

The CR acceleration due to shocks in the ISM depends upon multiple crossings approx. = c/3 v/ sub Alfven/ approx. = 10 exp 4 per e-fold energy gain. The up-stream scattering required to produce this barrier is Alfven wave turbulence. When the ratio (CR pressure)/(B exp 2 /8 pi) identical = beta > 1, the streaming velocity theoretically and observationally becomes >> v/sub Alfven/ and, hence, no effective up-stream barrier is likely to exist. If all ISM shock acceleration is limited to beta approx. << 1 and the average galactic CR conditions is beta approx. = 1, then shocks in the ISM are unlikely to supply the necessary acceleration. This is particularly so for high energy CR's accelerated early in the remnant history where beta must be large and the number of e-folds required are large. High energy CR's can be produced by the shock breaking out of the envelope into the magnetosphere of the SN star for E approx. > 10 exp 13 to 10 exp 14 eV. It is usually assumed that the energy dependent escape from the Galaxy E approx. > 10 exp 15 eV produces a steeper spectrum from 10 exp 15 to 10 exp 18 eV. Above this energy SN's in all galaxies fill the meta galaxy with CR's with a flatter slope. Conversely, an external source that attempts to fill the Galaxy from the outside must have a still steeper spectrum delta GAMMA approx. = -.75 to penetrate the diffusive barrier of our galaxy yet maintain the observed slope. This is unlikely since the energy density at 10 exp 15 eV in the meta galaxy would be between 10 exp -1 to 10 exp -2 of CR's in this galaxy or of the order of 10 exp 3 of the energy density of particles and fields in the IGM. S201 Catalog of Far-Ultraviolet Objects.
T. Page, G. R. Carruthers, and H. M. Heckathorn. 1981, 151p NASA-TM-82376, NRL-8173
Prepared in Cooperation with NRL, Washington, D.C.

The results of analysis of the images of stars and other discrete objects obtained from the lunar based far ultraviolet camera/spectrograph (experiment S201) are presented. The brightnesses of all objects are placed on an absolute scale of UV magnitudes based on instrument preflight calibrations. These magnitudes are compared with expectations based on stellar model atmosphere flux distributions, and with those obtained from calibrated OAO-2 observations. The data reduction programs are also described.

Distribution of Hot Stars and Hydrogen in the Large Magellanic Cloud.
T. Page, and G. R. Carruthers. 1981, 52p NASA-TM-82375
Contract NAS5-25481

Imagery of the Large Magellanic Cloud (LMC), in the wavelength ranges 1050 to 1600 A and 1250 to 1600 A, was obtained by the S201 far ultraviolet camera during the Apollo 16 mission. These images were reduced to absolute far-UV intensity distributions over the area of the LMC, with 3 to 5 arc min angular resolution. Comparison of these far-UV measurements in the LMC with H sub alpha and 21 cm surveys reveals that interstellar hydrogen in the LMC is often concentrated in 100 pc clouds within 500 pc clouds. Furthermore, at least 25 associations of O-B stars in the LMC are outside the interstellar hydrogen clouds; four of them appear to be on the far side. Far-UV and mid-UV spectra were obtained of stars in 12 of these associations, using the International Ultraviolet Explorer. Equivalent widths of L alpha and six other lines, and relative intensities of the continuum at seven wavelength from 1300 A to 2900 A, were measured. These spectra are also discussed.

PKS 2155-304 Relativistically Beamed Synchrotron Radiation from Bl Lac Object.
C. M. Urry, and R. F. Mushotzky. Mar 81, 32p NASA-TM-82101
Submitted for Publication.

The newly discovered BL Lacertae object, PKS 2155-304, was observed with the medium and high intensity energy detectors of the HEAO-1 A2 experiment. The variability by a factor of two in less than a day reported by Snyder, et al (1979) is confirmed. Two spectra, obtained a year apart, while the satellite was in scanning mode, are well fit by simple power laws with energy spectral index alpha sub 1 equals approximately 1.4. A third spectrum, of higher statistical quality, obtained while the satellite was pointed at its source, has has two components. An acceptable fit was obtained using a two power law model, with indices alpha sub 1 equals 2.0 (+1.2, -0.6) and alpha sub 2 equals -1.5 (+1.5, -2.3). An interpretation of the overall spectrum from radio through X-rays in terms of a synchrotron self-Compton model gives a good description of the data if allowance is made for relativistic beaming. Thus, from a consideration of the spectrum, combined with an estimate of the size of the source, the presence of jets is inferred without their observation.

Cusp Region Particle Precipitation and Ion Convection for Northward Interplanetary Magnetic Field.
J. L. Burch, P. H. Reiff, R. W. Spiro, R. A. Heelis, and S. A. Fields. 1981, 12p NASA-TM-80763
Contract NGR-44-004-120

Data from Atmosphere Explorer D for periods of strong northward interplanetary magnetic field are discussed. In the dayside magnetospheric cusp region energy time spectrograms of suprathermal positive ion fluxes exhibit a characteristic 'V' pattern as the spacecraft moves toward higher latitudes; that is, with the peak in the energy spectrum falling in energy and then rising again. Convection velocities follow this pattern closely with strong eastwest flows (with antisunward components) occurring in the equatorward half of the 'V' and significant sunward flows occurring in the poleward half of the 'V'. These patterns can be understood qualitatively in terms of a model of ionospheric electric potential produced by the known dependence of Birkeland current densities on magnetic activity.

Cooling of Young Neutron Stars and the Einstein X-Ray Observations.
K. Nomoto, and S. Tsuruta. Jun 81, 21p NASA-TM-82145
Submitted for Publication.

Cooling of neutron stars is calculated using an exact stellar evolution code. The full general relativistic version of the stellar structure equations are solved, with the best physical input available. For neutron stars with a stiff equation of state, it is found that the deviation from the isothermality in the interior is significant and that it takes at least a few thousand years to reach the isothermal state. By comparing theoretical and observational results, it is concluded that for Cas A, SN1006, and probably Tycho, standard cooling is inconsistent with the results from the Einstein Observatory, if neutron stars are assumed to be present in these objects. On the other hand, the detection points for RCW103 and the Crab are consistent with these theoretical results.

Cometary Particulate Analyzer Design Definition Study.
Final Report.
N. G. Utterback. Jan 81, 85p NASA-CR-164524, TRW-34645
Contract NASW-3314

A concept for remotely determining the relative abundance of elements contained in cometary particulates collected by a spacecraft was conducted with very encouraging results. The technique utilizes a short high intensity burst of laser radiation to vaporize and ionize collected particulate material. Ions extracted from this laser-produced plasma are analyzed in a time of flight mass spectrometer to yield an atomic mass spectrum representative of the relative abundance of elements in the particulates. A prototype analyzer system was designed, constructed, and tested. Results show that: (1) energy-time focus performs as predicted in improving resolution; (2) power densities sufficient to produce usable ionization efficiencies can be obtained; (3) complex alloys such as stainless steel can be analyzed; and (4) a tiny, simple and reliable laser used in the demonstration easily meets spacecraft power and mass limitations. A mass resolution of 150 was experimentally

demonstrated at mass 108, and an analytical extrapolation predicts a resolution sufficient to separate masses 250 and 251.

The Cooling and Condensation of Flare Coronal Plasma.
S. K. Antiochos, and P. A. Sturrock. Apr 81, 24p NASA-CR-164506, SU-SUIPR-839
Contracts NGL-05-020-272, N00014-75-C-0673

A model is investigated for the decay of flare heated coronal loops in which rapid radiative cooling at the loop base creates strong pressure gradients which, in turn, generate large (supersonic) downward flows. The coronal material cools and 'condenses' onto the flare chromosphere. The features which distinguish this model from previous models of flare cooling are: (1) most of the thermal energy of the coronal plasma may be lost by mass motion rather than by conduction or coronal radiation; (2) flare loops are not isobaric during their decay phase, and large downward velocities are present near the footpoints; (3) the differential emission measure q has a strong temperature dependence.

Synchrotron Brightness Distribution of Turbulent Radio Jets.
R. N. Henriksen, A. H. Bridle, and K. L. Chan. Jun 81, 45p NASA-CR-164262, SU-SUIPR-844
Contract NGR-05-020-668

Radio jets are considered as turbulent mixing regions and it is proposed that the essential small scale viscous dissipation in these jets is by emission of MHD waves and by their subsequent strong damping due, at least partly, to gyro-resonant acceleration of supra-thermal particles. A formula relating the synchrotron surface brightness of a radio jet to the turbulent power input is deduced from physical postulates, and is tested against the data for NGC315 and 3C31 (NGC383). The predicted brightness depends essentially on the collimation behavior of the jet, and, to a lesser extent, on the CH picture of a 'high' nozzle with accelerating flow. The conditions for forming a large scale jet at a high nozzle from a much smaller scale jet are discussed. The effect of entrainment on the prediction is discussed with the use of similarity solutions. Although entrainment is inevitably associated with the turbulent jet, it may or may not be a dominant factor depending on the ambient density profile.

Radio Jet Refraction in Galactic Atmospheres with Static Pressure Gradients.
R. N. Henriksen, J. P. Vallee, and A. H. Bridle. May 81, 30p NASA-CR-164260, SU-SUIPR-845
Contract NGR-05-020-668

A theory of double radio sources which have a 'Z' or 'S' morphology is proposed, based on the refraction of radio jets in the extended atmosphere of an elliptical galaxy. The model describes a collimated jet of supersonic material bending self-consistently under the influence of external static pressure gradients. Gravity and magnetic fields are neglected in the simplest case except insofar as they determine the static pressure distribution. The calculation is a straightforward extension of a method used to calculate a ram-pressure model for twin radio trails ('C' morphology). It may also be described as a continuous-jet version of a buoyancy model proposed in 1973. The model has the added virtue of invoking a galactic atmosphere similar to those already indicated by X-ray measurements of some other radio galaxies and by models for the collimation of other radio jets.

A Model of the Normal and Null States of Pulsars,
P. B. Jones. 1981, 25p 24/81

A solvable three-dimensional polar cap model of pair creation and charged particle acceleration has been derived. There are no free parameters of significance apart from the polar surface magnetic flux density. The parameter CO determining the acceleration potential difference has been obtained by calculation of elementary nuclear and electromagnetic process. Solutions of the model exist for both normal and null states of a pulsar, and the instability in the normal state leading to the normal to null transition has been identified. The predicted necessary condition for the transition is entirely consistent with observation.

Compressible Convection in a Rotating Spherical Shell,
Gary A. Glatzmaier. 1980, 200p NCAR-CT-60
Grant NSF-ATM77-23757

A hydrodynamical model of giant cell convection is used to gain further understanding of how differential rotation is maintained on the Sun. This model includes three major requirements for such an undertaking: rotation, spherical geometry, and compressibility. However this work represents only the first step for such models because it is limited to linear, single mode calculations. The work begins with the derivation of anelastic fluid equations for a compressible, rotating, spherical fluid shell. Then first order numerical solutions of these equations are found which describe the stability and structure of the giant cell convection in many different regions of parameter space. First order analytic solutions provide simple, physical explanations for the longitudinal phase propagation manifested in the numerical solutions. Second order numerical solutions are then calculated which described the mean differential rotation and meridional circulation induced by the first order solutions.

Search for Optimal Three-Dimensional Mapping of the Solar Corona from K-Coronameter Data.
Technical note,
R. Michael Perry, and Martin D. Altschuler. Apr 81, 102p NCAR/TN-170
Grant NSF-ATM77-23757

To obtain improved maps of the coronal electron density distribution the authors have devised an iterative technique in which an approximation of the unknown distribution is sucessively modified to reduce discrepancies with the original data. With this technique, they can now map the corona to a much finer resolution than shown in their previous papers, without greatly increasing the computational cost. The series representation of density may now contain more than 23,000 terms compared with the previous limit of 128. This results in a fourfold increase in linear resolution, so that features about a tenth of a solar radius in width are now separate. The iteration algorithm can be adjusted to apply a mathematically 'optimal' correction to a given approximation of the density. Although this correction minimizes noise levels, a cheaper version of the algorithm yields a better result.

Experimental Investigation of Atmospheric Response to the Total Solar Eclipse of 26 February 1979. Conduct of Field Measurements. Phase III.
18 Apr 79, 180p
Contract DAAD07-78-C-0058

Principal objectives of the experimental program centered upon measurements of background atmospheric parameters and their changes during the eclipse in the altitude range of 30-200 km. The experimental program was highly successful. Approximately 96 percent of the more than 80 measurements carried out by the sounding rockets were successful in terms of instrument operation. During the eclipse energetic particles were precipitating into the atmosphere, a factor of considerable importance in the analysis of data obtained from the experimental program. The field program entailed coordinated operations at several sites with physical separations of up to 25 miles. Despite the generally cold weather (temperatures as low as -40 C), snowy conditions and nature of temporary installations, the oeprations were successful in meeting an inflexible schedule of activities while maintaining the critical ground support power, communications, telemetry and tracking.

Effect of Transmission of Pulsed High-Power 10.6 Micrometer Laser on Atmosphere,
Zhiben Gong. 22 Oct 79, 6p
Included in Kexue Tongbao, v25 n6 p466-471 Jun 80.

The presence of atmospheric kinetic cooling caused by atmospheric absorption of 10.6 micrometer laser radiation has been proved through theoretical analysis and experiment. Breig expanded the work done by Wood et al. and after considering the adsorption saturation effect which was neglected by Wood et al., got an analytic expression for atmospheric temperature change caused by the atmospheric absorption of high-power CO2 laser radiation. However, they assumed the specific heat capacity at constant pressure and volume respectively. Now some problems have been encountered in he process of laser beam transmission through actual atmosphere. Under what conditions are the above assumptions to be made. Under what conditions can the absorption saturation effect be neglected. Can a much more general analytic expression of the atmospheric temperature change be derived. This paper is an attempt by the author to answer these questions.

Optical Attenuation in Clouds from Inversion of Multi-Wave-Length and Multi-Angle Lidar Data.
Technical memo.,
M. J. Post, and F. F. Hall, Jr. Apr 80, 24p NOAA-TM-ERL-WPL-68, NOAA-81050609
Sponsored in part by Naval Ocean Systems Center, San Diego, CA.

The purpose of this study was to determine if optical attenuation in clouds could be accurately determined solely by inverting multi-wavelength and multi-angle lidar data by means of the Backus-Gilbert inversion technique. This is an indirect method to attain the attenuation coefficient as the Backus-Gilbert inversion provides an estimate of the cloud droplet size distribution, and from this distribution the attenuation coefficient might then be calculated. This study directed its attention to a more narrow range of scattering angles. Specifically, there is a requirement to measure optical attenuation from naval ships so that bistatic lidar configuration would be limited by the dimensions of the vessel carrying the equipment. Although other methods of inverting lidar returns may yield 'better' results than Backus-Gilbert, this inversion technique permits one to investigate the information content of the measurements being made. Visually displaying the averaging kernels also helps indicate where and why errors in the results occur, and defines over what size interval the retrieved number density is applicable.

An Analysis of Cloud Property Retrieval Using Infrared Sounder Data,
Bruce A. Wielicki. 1980, 139p NCAR-CT-61
Grant ATM77-23757

This thesis presents a theoretical analysis for the retrieval of cloud properties using infrared sounding radiometer data, such as that collected by the HIRS-2 instrument on TIROS-N. The cloud properties considered are effective cloud amount (emissivity times cloud fractional coverage in the satellite field of view), cloud top pressure, and the ratio of cloud emissivities in different spectral regions of the infrared. Chap. 1 examines the cloud amount errors and cloud top pressure errors caused by instrument noise and by uncertainties in estimated clear-sky radiances due to temp. profile and water vapor profile uncertainties. Chap. 2 examines the retrieval errors appropriate for a cloud climatology of average cloud amount within 1 km cloud height intervals. Chap. 3 examines the variation of cloud emissivity for the HIRS instrument spectral channels. Chap. 4 examines errors for the retrieval of HIRS channel emissivity ratios.

Study of Remote Wind Measurement Using Acoustic Angle-of-Arrival Techniques.
Final rept. Mar 78-Feb 81,
Philip B. Russell, Edward M. Liston, and Stephen A. DeLateur. Apr 81, 53p ARO-13850.1-GS
Contract DAAG29-78-C-0009

An angle-of-arrival sodar system was designed, built, and tested with the goal of determining boundary-layer winds. The system measures the backscattered signal induced in two closely space microphones on a single parabolic receiver antenna; the angle of arrival is calculated from the relative signal amplitudes. This is the acoustic analog of the amplitude-monopulse radar technique. However, the acoustic system uses distributed (atmospheric) targets and a fixed (not steerable) antenna. Test demonstrated that the system can receive atmospheric echoes and process the analog signals to estimate angle-of-arrival (hence, layer-averaged wind) when signal-to-noise ratios are adequate. However, the validity of these wind estimates was not demonstrated with correlative wind data. Digital processing techniques were implemented with the goals of automatic wind calculation, identification of adequate signal-to-noise ratios, and noise subtraction. Computer hardware limitations prevented achieving these goals. However, we believe that they could be achieved by using a computer with larger memory capacity. (Author)

Environmental Data for Sites in the National Solar Data Network.
May 81, 188p SOLAR/0010-81/05
Contract AC01-79CS30027
Microfiche only after original copies are exhausted.

Environmental information collected at the sites of the National Solar Data Network is presented in the form of tables for each solar site. The sites are grouped into 12 zones, each of which consists of several adjacent states. The insolation table presents the total, diffuse, direct, maximum, and extraterrestrial radiation for the solar site. It also shows the ratio of total to extraterrestrial radiation, as a percent. The temperature table gives the average, daytime, nighttime, maximum, minimum and inlet-water temperatures for the solar site. All of the passive and some of the active solar sites are equipped with wind sensors which provide information for two wind tables furnishing wind speed and direction. For some sites, a humidity table provides relative humidity values for day and night. It also gives values for the maximum and minimum humidity for each day. A technical discussion of the instruments and measurements used to obtain these data tables is included. (ERA citation 06:023265)

Charged Particle Concepts for Fog Dispersion.
Final Report.
W. Frost, F. G. Collins, and D. Koepf. Jun 81, 122p NASA-CR-3440
Contract NAS8-33541

Charged particle techniques hold promise for dispersing warm fog in the terminal area of commercial airports. This report focuses on features of the charged particle technique which require further study. The basic physical principles of the technique and the major verification experiments carried out in the past are described. The fundamentals of the nozzle operation are given. The nozzle characteristics and the theory of particle charging in the nozzle are discussed, including information from extensive literature on electrostatic precipitation relative to environmental pollution control and a description of some preliminary reported analyses on the jet characteristics and interaction with neighboring jets. The equation governing the transfer of water substances and of electrical charge is given together with a brief description of several semi-empirical, mathematical expressions necessary for the governing equations. The necessary ingredients of a field experiment to verify the system once a prototype is built are described.

Illinois Third Consecutive Severe Winter: 1978-1979.
Rept. of investigation,
Stanley A. Changnon, David Changnon, and Phyllis Stone. 1980, 42p ISWS/RI-94/80

In 1978-1979 a third consecutive severe winter occurred in Illinois for the first time since records began in the 1880s. Seventeen major winter storms, the state's record coldest January-February, and record snow depths gave the winter of 1978-1979 a rank as the second worst statewide for Illinois, exceeded only by the prior winter of 1977-1978. In the northern fourth of Illinois, the 1978-1979 winter was the worst on record. Average snowfall for the state was 42.8 inches, or 23.3 inches above normal. The 1978-1979 winter had a myriad of socioeconomic impacts, the most serious ones in the Chicago metropolitan area. Ten deaths and at least 60 serious injuries were attributed to the storms.

Variations in Climatic Characteristics as Related to Evapotranspiration in South Park, Central Park County, Colorado.
Final rept.,
Norman E. Spahr. 1981, 161p USGS/WRI-80-86, USGS/WRD/WRI/81-047

Data collected during May through September in 1977, 1978, and 1979 at three stations were analyzed using an analysis of variance technique to determine variations in climatic characteristics in South Park. Knowledge of these climatic characteristics will aid in determining the amount of water that may be transferred from agricultural use in South Park to municipal use in the Denver metropolitan area. Daily minimum air temperature, daily average air temperature, cumulative wind, daily relative humidity, and daily solar radiation were statistically different between the three stations at the 1-percent level of significance. Daily maximum air temperature and daily pan evaporation were not significantly different between the three stations.

Summary of AEC-ERDA-NRC Supported Research at NSSL 1973-1979.
Technical memo.,
J. T. Lee, Dusan S. Zrnic', Robert P. Davies-Jones, and Joseph H. Golden. Mar 81, 110p NOAA-TM-ERL-NSSL-90, NOAA-81043004

In 1973, the mutual interest in tornado wind and pressure structure witnessed the formation of a cooperative research program between the National Oceanic and Atmospheric Administration's (NOAA) National Severe Storms Laboratory at Norman, Oklahoma and the Atomic Energy Commission (AEC) with its successor organization the Energy Research and Development Administration (ERDA) and the Nuclear Regulatory Commission (NRC). This report presents an overview of the research and results generated through the coordinated effort. This research proceeded along several lines - direct observations such as radar and photographic, indirect observations such as damage inferred wind flows, and modeling.

The Wind Climatology of American Samoa.
Technical memo.,
John C. Bortniak. Mar 81, 72p NOAA-TM-ERL-ARL-98, NOAA-81050611

From an investigation of the tropical Pacific winds using previous work done in this area, three major sources of Samoa air were identified. The easterly trade winds are the most frequent source, and southerly air from the east of Australia occurs a large percentage of the time. The third source, occurring only a few percent of the time in the austral summer, is direct Northern Hemisphere air, which is normally blocked by the (ITCZ) Intertropical Convergence Zone. General features of tropical Pacific winds are also discussed.

Climate Diagnostics Workshop (5th) Annual Proceedings Held at Joint Institute for the Study of Atmosphere and Ocean, University of Washington, Seattle on October 22-24, 1980,
Jay S. Winston. Mar 81, 402p NOAA-81050604
See also Annual rept. no. 2. PB-282 151.

The Fifth Annual Climate Diagnostics Workshop, held at the Joint Institute for the Study of the Atmosphere and Ocean, University of Washington, Seattle, on October 22-24, 1980, began with a review of the past year's climate fluctuations. This was followed by more general studies of variations in the large scale circulation. Session 3 dealt with data and methods for monitoring snow and ice, water vapor, and volcanic aerosols. Sessions 4 and 5 concentrated on the second major topic of large scale sea-air interactions with principal emphasis in Session 4 on the equatorial Pacific, Southern Oscillation, El Nino, and related phenomena. Session 6 dealt with modeling results.

U.S. Monsoon Experiment (MONEX) Rawinsonde/Radiometersonde System,
Gerald A. Meehl, Robert B. McBeth, William C. Bolhofer, and Sushil Unninayar. Nov 80, 54p NCAR-TN/164+EDD
Grant NSF-ATM77-23757

The technical note describes a procedure to convert rawinsonde and radiometersonde observations from raw data into the standard message format in the field with the use of two inexpensive programmable calculators and a miniaturized wind-plotting board. The unique combination of elements of an automatic processing system concept (i.e. the simple programmable pocket calculator) and aspects of the more conventional graphical analysis method (i.e. the small-scale wind-plotting board) makes the system described here economical, portable, and easy to operate by supporting personnel with a minimum of training, especially in locations with difficult logistical requirements. This method was developed at the National Center for Atmospheric Research (NCAR) for use with portable rawinsonde and radiometersonde systems at remote field sites in Southeast Asia and Nepal in support of the upper-air observational program of the International Monsoon Experiment (MONEX) in 1978-79. The success of the system and data analysis method points to its use as a reference for future field applications.

Contractor-Furnished Equipment versus Government-Furnished Equipment.
Final rept.,
Charles M. Lowe, Jr. May 81, 60p Rept no. APRO-80-10

Two methods are utilized to provide the components/sub-systems for a Government contract: contractor-furnished equipment (CFE) or Government-furnished equipment (GFE). DAR 13-201 states it is the general policy of the Department of Defense that contractors will furnish all equipment required for the performance of Government contracts. However, the Government should furnish equipment to a contractor when it is determined to be in the best interest of the Government by reason of economy, standardization, the expediting of production, or other appropriate circumstances. A model is developed to assist in the analysis for a decision to use CFE or GFE. The use of structured analysis of the subjective areas involved in using either approach provides for a more defensible business decision. (Author)

See also Rept. no. MCR-TR-8006-1.

Management Consulting & Research, Inc. (MCR) has developed analytical tools to assist in evaluating weapon system manpower requirements. The tools are: a definition for analyzing weapon system unit manpower requirements in terms of their high-cost/critical occupations; and a methodology for costing weapon system unit manpower which reveals occupation- and pay grade-specific cost relationships of the weapon system unit manpower requirements. This report documents the following results: The application of the definition of high-cost/critical occupations, which is a refinement of the Phase I definition. A description of the unit sustainment manpower cost methodology, which includes a refinement of the initial unit methodology. The unit sustainment manpower cost data for selected weapon systems that refines the initial unit test data. A description and demonstration of the unit manpower life cycle cost methodology which includes initial unit and unit sustainment cost methodologies. The application of the analytical tools in the analysis of weapon system manpower requirements. The definition and cost methodology are demonstrated using unit manpower for three major weapon systems: the Army M-1 tank, the Navy LAMPS Mk III helicopter system, and the Air Force ground launched cruise missile. Development of an Organizational Survey Feedback Program for the 32D Air Defense Command.
Final rept.,
Donald G. Walizer, and John R. Mietus. Mar 80, 56p Rept no. ARI-TR-433

In the U.S. Army's Organizational Effectiveness Program, the General Organization Questionnaire (GOQ) serves as the primary diagnostic survey instrument for measuring organizational climate. This project: (a) tailored the GOQ and its data processing (ADP) and feedback systems to the unique situation of the 32d Air Defense Command (AADCOM); and (b) examined the psychometric properties of the basic GOQ instrument. The GOQ was tailored to the 32d AADCOM's situation. It was administered to more than 2,000 headquarters battery personnel in late 1977. Because there was no GOQ ADP system in U.S. Army-Europe (USAREUR) during the project, systems for processing data and returning results to commanders were built and then used. Interscale correlation and inter-item reliability coefficients were computed. To help assess the impact of the procedures as viewed by commanders, a short evaluative questionnaire was used. Five of six major indices of the GOQ were left intact; these measured unit climate, supervisory leadership, co-worker interaction, and work group processes. Questions on norms and values, job satisfaction, personal adjustment, family life, and equal opportunity were added. Internal consistency scale reliability coefficients averaged .75. There was no curtailment in the range of item responses. Interscale correlation coefficients are higher than desired in an instrument used for differential diagnoses. The data processing system was unwidely but workable. Data feedback was to the top levels of the command, where it had policy impact; and to battery commander, where it had minimal practical impact, as perceived by unit commanders.

See also Rept. No. UM-81-1-158.

Within the Department of Defense's (DoD's) planning, programming, and budgeting system (PPBS), the role of programming is to transform defense needs into a time-phased program of affordable and achievable defense activities. Priorities among these activities must be established, and this requires professional military as well as civilian government judgments about the relative importance of various defense needs. Thus the programming phase of PPBS is the critical step in which professional judgment is matched to resources to create the tangible objectives of the DoD. To strengthen its programming system within the Dod PPBS, the Marine Corps (MC) has recently introduced and tested new, more efficient and reliable techniques for collecting and utilizing the professional judgment of its staff. The new techniques have been developed using the management discipline of decision analysis. The result is a practical, conceptually advanced methodology that has succeeded in developing consensus among the MC staff where other procedures have failed. This report describes the decision-analytic methodology used by the MC in its programming, not merely overviews. It is suitable as a reference, and it may be used for training. (Author)

Enhanced Decision Analysis Support System.
Master's thesis,
David B. Lee. Mar 81, 173p Rept no. AFIT/GST/OS/81M-8

The enhanced version of the Decision Analysis Support System (DASS) is a highly interactive computer-aided decision analysis tool. It automates the method for determining preferences when multiple and competing attributes are involved. Worth assessment is used as the model which evaluates a deterministic hierarchical tree structure, although risk can be evaluated by incorporating risk into the tree or by conducting sensitivity analyses. The objective of this work was to incorporate the DASS (originally developed by Bruce W. Morlan) onto a microcomputer using PASCAL. The second objective was to exploit the color graphics capability on the microcomputer system for both input and output displays. The final objective was to add capability to the DASS by adding additional sensitivity analysis modules. All objectives were met in this work. Additional exploitation of the computer graphics, as well as some preprocessing of the tree structure are areas suggested for further exploration. (Author)

A Multi-Attribute Decision Analysis Approach to the Development of a Computerized Aid to Mission Planning (MADCAMP).
Master's thesis,
Robert H. Whitney, and Jack L. Wilson. Mar 81, 168p Rept no. AFIT/GST/OS/81M-11

This study investigates the problem of real time low-level mission planning against highly transient targets within the Battlefield Air Interdiction (BAI) environment. The dual objective was to test the feasibility of a computerized mission planning aid and reducing computer memory requirements to a level that would allow implementation of the mission planning aid on a modern mini-computer system. The model is based on concept of using Multi-Attribute Decision Analysis (MADA) to capture the decision making process of experienced mission planners and Selective Terrain Mapping (STM) to reduce the computer data storage requirements. The model uses a dynamic programming algorithm to produce an 'optimal' flight path through a given environment. Optimality is based entirely on the ability to capture the mission planners decision making process. From the results of this study, it was concluded that the approach is feasible, the model will produce acceptable flight paths, the mission planners' decision making process can be captured using MADA, and STM will adequately reduce the computer storage requirements. Timeline Resource Analysis Program (TRAP): User's Manual and Program Document.
J. G. Sessler. Jun 81, 158p NASA-CR-161812
Contract NAS8-31640

The Timeline Resource Analysis Program (TRAP), developed for scheduling and timelining problems, is described. Given an activity network, TRAP generates timeline plots, resource histograms, and tabular summaries of the network, schedules, and resource levels. It is written in ANSI FORTRAN for the Honeywell SIGMA 5 computer and operates in the interactive mode using the TEKTRONIX 4014-1 graphics terminal. The input network file may be a standard SIGMA 5 file or one generated using the Interactive Graphics Design System. The timeline plots can be displayed in two orderings: according to the sequence in which the tasks were read on input, and a waterfall sequence in which the tasks are ordered by start time. The input order is especially meaningful when the network consists of several interacting subnetworks. The waterfall sequence is helpful in assessing the project status at any point in time.

Federal Interagency Committee on Urban Noise, Washington, DC.
Guidelines for Considering Noise in Land Use Planning and Control.
Jun 80, 55p

The purpose of this document is to put the various Federal agency policy and guidance packages into perspective. Although this document does not replace the individual Federal agency material, it can serve as the departure point for dealing with each agency's programs and facilitate the consideration of noise in all land use planning and interagency/intergovernmental coordination processes. Noise, like soil conditions, physiographic features, seismic stability, floodplains and other considerations, is a valid land use determinant. Scientific evidence clearly points to noise as not simply a nuisance but an important health and welfare concern. The purpose of considering noise in the land use planning process is not to prevent development but rather to encourage development that is compatible with various noise levels. The objective is to guide noise sensitive land uses away from the noise and encourage non-sensitive land uses where there is noise. Where this is not possible, measures should be included in development projects to reduce the effects of the noise.

The Design and Implementation of an Office Application Using Existing High Level Tools.
Final rept.,
A. Mink, J. Knoerdel, and J. Brooks. 28 May 81, 13p
Proceedings of the Trends and Applications 1981: Advances in Software Technology held at Gaithersburg, MD., p150-162, 28 May 81.

An experiment was conceived to provide insight into the problems of implementing computer based office application (CBOA) services using existing high level computer based office systems (CBOS) tools. The first step was to select a routine office application that was currently being performed in our environment, and an existing hight level CBOS tool on which to build support for this application. Once the application and tool were selected, the office workers affected by this CBOA were encouraged to participate in the design and implementation process to gain the maximum feedback. The goals were to accomplish this implementation by using existing CBOS tools, doing no programming, and to have the users understand the implementation as well as the designers.

Aid in Decision-Making for Real Time Workshop Management (Aide a la Decision pour l'Ordonnancement d'Atelier en Temps Reel).
Doctoral thesis,
Veronique Thomas. 26 Jun 80, 162p ORDER-2360
Text in French.

This study is concerned with the short-term level of decision-making. It is a special approach to real-time decision-making, based on a special concept of aids to decision-making. Possible decisions are set forth and analyzed in terms of internal constraints (technological, use of resources) and external restraints, such as due dates fixed at the mid-range level of decision-making. Decisions are selected on the basis of the concept of a critical track, set forth on a planning chart. An underlying framework of acceptable solutions is worked out as a series of group sequences. Management function is broken down into sections; models for each solution are developed. Results are computerized for aid in the decision-making process.

National Training and Development Service for State and Local Government, Washington, DC.
Applying Science and Technology to Improve Local Government Productivity,
K. Janka, K. D. Rainey, F. Knight, and T. Urban. Dec 80, 110p NSF/RA-800488
Grant NSF-ISP77-19055
Prepared in cooperation with International City Management Association.

Some insights are outlined for ways to improve productivity and decrease the cost of local government service by making more effective use of science and technology (S&T). Existing systems of government can be modified through S&T input to the areas of perceptions and attitudes, authority systems, organizational structure, work methods, work flow and organization, and work force skills. Results of a survey of 205 cities indicated the high priority items to be able to predict ramifications and weigh consequences; ability to work with other departments; ability to train personnel; employee and labor relations; and human relations. Technology transfer must be supplemented by behavioral concepts concerning personal needs and intergroup relations of the workers. Steps involved in the process include preparation, or understanding the problems of the organization; formulation, or clarifying the issues; designing solutions; making plans and taking action; and evaluating the changes resulting from the actions taken. Early involvement of workers in identifying problems and implementing solutions is stressed.

Vermont State Planning Office, Montpelier.
State Science, Engineering and Technology Project.
May 80, 12p NSF/RA-800501
Grant NSF-ISP80-04613

The Vermont State Science, Engineering, and Technology (SSET) Project was initiated to create a reservoir of expertise that could be tapped to provide advice to key decisionmakers on the scientific and technological (S&T) aspects of major issues facing the State. This report presents the plan and program for implementation of the project. It assesses the project's potential; outlines the structure, process, and procedure of the program; discusses linkage to SET resources; and identifies priorities for policy research and analysis. A review of five-year agency plans indicates the need for research and analysis in the following areas: transportation, development and community affairs; environmental conservation; education; energy; labor and industry; and health. Specific tasks for implementing the project are summarized.

Research Applied to National Needs--1971-1977: A Program History of the First Six Years,
Arley T. Bever. May 78, 182p NSF/RA-780559
See also Volume 2, PB81-221293.

The survey, covering the period from March 1971 through March 1977, concentrates mainly on the first three years during which the initial organization and establishment of the RANN program policies and goals took place. It describes the policy shift at NSF from one in which research decisions

were left entirely to scientists to one in which public accounting of Federal expenditures for research and development (R&D) was required. Concepts and resulting actions which eventually led to the establishment of RANN as a free-standing applied domestic research funding program of the Federal government are outlined. Included are origins of the RANN task force, RANN criteria for judging the suitability of research projects, the role of Congress, beginning problems of the energy program build-up and transfer, RANN reorganization, and a study of RANN strategy, future program directions, and evaluation.

Research Applied to National Needs--1971-1977: Interviews with People Important to Its Early History, Volume II,
Arley T. Bever. 1978, 297p NSF/RA-780560
See also PB81-221285.

The volume presents the history of the first six years of the National Science Foundation's (NSF) program--Research Applied to National Needs (RANN). It consists of 14 interviews with people involved in the conception, organization, and implementation of the RANN program during the period of March 1971 through March 1977. The interviews were conducted between September 1976 and July 1977. Topics discussed include the RANN program's role in furthering immediate scientific needs of society; NSF's interaction with other government agencies as a result of RANN projects; the growth of NSF support for applied research through RANN; funding, organization ans staffing of RANN; and an evaluation and future research directions for the RANN program.

General Accounting Office, Washington, DC. Accounting and Financial Management Div.
Status, Progress, and Problems in Federal Agency Accounting During Fiscal 1980.
Rept. to the Congress.
25 Jun 81, 64p AFMD-81-58
See also 1977, PB-281263.

Federal agency accounting systems are required to conform to the principles and standards prescribed by the Comptroller General. At September 30, 1980, 193 of the 301 accounting systems in the Federal Government had been approved. However, the unapproved systems account for the expenditures of more than half the Federal budget. In addition, many systems approved over a decade ago need to be reapproved. GAO reviews of accounting systems in operation are also summarized in the report.

Standard Technical Manual Identification Numbering System (TMINS). M0000-00-IDX-000 TMINS.
14 May 80, 168p
Supersedes report dated 1 Jun 78.

The Standard Technical Manual Identification Numbering Systems (TMINS) has been promulgated to initiate the implementation of a single significant numbering system for technical manuals and related technical documents procured by Naval Material Command (NMC) Components. TMINS may also be used for identifying publications and other documents when it is desired that they may be centrally controlled, tracked and indexed. The use of the single numbering systems will eliminate the complications in the Fleet that now result from the different numbering systems in use. In addition the single numbering system will aid the standardization of cataloging within the Systems Commands and will simplify the interfaces between TM data collection and TM information systems. This index and guide has two purposes: (1) To explain the concepts of the TMIN System and the composition of the TMINS number. (2) To provide the necessary data for proper applications of TMINS numbers.

The Production of the AGARD Multilingual Aeronautical Dictionary Using Computer Techniques,
Van A. Wente, J. C. Kirschbaum, and J. H. Kuney. Apr 81, 46p Rept no. AGARD-R-684

The AGARD Multilingual Aeronautical Dictionary (MAD), second edition, published in 1980, contained 7,300 technical terms defined in English but also translated into nine other languages. The preparation work was performed by some 250 scientists and engineers who were members of AGARD and involved the translation skills of staff in many of the NATO nations. Nearly all the compilation and setting work for the book was done by computer and automatic photo-composition, a task of great complexity and one which is unique. The purpose of this publication is to record how the task was approached, in terms of management planning; to state frankly what went wrong, so that these errors will not be repeated; and to make some modest reference to the successes of the programme. It does not deal in great detail with the technical aspects of the task. (Author)

Applicability of SREM to the Verification of Management Information System Software Requirements. Volume I.
Final rept.,
R. P. Loshbough, M. W. Alford, J. T. Lawson, D. M. Sims, and T. R. Johnson. 30 Apr 81, 203p
Rept no. TRW-37554-6950-001-VOL-1
Contract DAHC26-80-C-0020
See also Volume 2, AD-A100 721.

This document concerns TRW's demonstration of the application of the Software Requirements Engineering Methodology (SREM) to an existing Government Detailed Functional System Requirements (DFSR). The objective of this effort was to demonstrate the power of SREM as a tool to verify a software requirement, with the goal of determining the extent to which it was a complete, consistent, and unambiguous document. Specifically, the intent was to attain an understanding of what SREM is, how it is used, and what capability it possesses for isolating discrepancies in an existing software specification. In addition, this effort was intended to provide the basis for assessing the potential of SREM for inclusion as a tool in the current Army ADP-system development life cycle.

Final rept. 1 Jan-31 Dec 80,
Cho-Yen Ho. May 81, 141p AMMRC-TR-81-26
Contract DLA900-79-C-1007

This Annual Final Report on Contract No. DLA900-79-C-1007 covers the activities and accomplishments of the Thermophysical and Electronic Properties Information Analysis Center (TEPIAC) for the period 1 January to 31 December 1980. TEPIAC's activities reported herein include literature search, acquisition, and input of source information; documentation review and codification; material classification; information organization; operation of a computerized bibliographic information storage and retrieval system; data extraction and compilation; data evaluation, correlation, analysis, synthesis, and generation of recommended values; preparation and publication of handbooks,

data books, properties literature retrieval guides, state-of-the-art reports, critical reviews, and technology assessments; development of a computerized numerical data storage and retrieval system; technical and bibliographic inquiry services; and current awareness and promotion efforts. TEPIAC covers 14 thermophysical properties and 22 electronic, electrical, magnetic, and optical properties of nearly all materials at all temperatures and pressures and in all environments.

A Generalized Experiment Control and Data Acquisition System.
Master's thesis,
Arsenio R. Iloreta. Mar 81, 96p Rept no. AFIT/GCS/EE/81M-3

A portable, automated, generalized experiment control and data acquisition system was developed for the Materials Laboratory to fulfill some of its data automation needs. The system is portable in that all hardware components fit in an aluminum carrying case, except for the terminal which is separate. The need for portability requires the program to be loaded from the terminal minicassette tape. The collected data is likewise dumped into the minicassette. The Air Force method of requirements definition, IDEF0, was used to model the software requirements. It involves a top-down approach to development. The model, thus diagrammed, provided the general structure from which the program itself was written. Structured code and ample documentation form the basic programming technique implemented. The program is currently operational, the system having been utilized in two actual experiment set-ups. The requirement to load the program from the minicassette was not satisfied, however, because of some loader error. The program can presently be loaded using a floppy disk system.

Manual of Documentation Practices Applicable to Defence-Aerospace Scientific and Technical Information. Volume IV. Section 10 - Security Storage and Control. 11 - Organisation and Management. 12 - Networks and External Sources of Information,
S. C. Schuler. Mar 81, 128p Rept no. AGARD-AG-235-VOL-4
See also Volume 1, AD-A060 478.

The last of four separately published volumes describing the basic documentation practices involved in the initial setting up and operation of an Information-Library organisation to provide defence-aerospace information services. The focus is on a practical, rather than theoretical, approach for both the senior person setting up a new system as well as junior staff who may be using the manual as a training aid. This volume consists of three main sections. The first is concerned with basic problems in the security control and storage of classified and other sensitive documents. Guidelines are given for setting up procedures for document movements, housekeeping and physical security. The second section gives a general background to organisational factors involved in establishing an information centre. It also discusses accommodation requirements, staffing, budgets and promotional activities. In the final section the basic aspects of the telecommunications and networking are reviewed and information given on the availability and use of on-line data bases in the USA and Europe. (Author)

Perspectives on scientific and technical information symposium, Oak Ridge, TN, USA, 9 Sep 1980. Microfiche only after original copies are exhausted.

The first symposium on scientific and technical information sponsored by the Oak Ridge National Laboratory's Information Center Complex was held September 9-10, 1980, in Oak Ridge, Tennessee. The symposium emphasized the growth of the information field as an important resource to researchers and examined the wide range of subject-related programs, facilities, and systems that are available. Ten speakers, representing industry, academia, and government, presented up-to-date coverage of the many facets of information work. Topics covered included prospect and challenges, analysis patterns, transparent systems, the role of marketing, entrepreneurial opportunities, the management of data bases and federal libraries, and a review of the field from early automated efforts to futuristic possibilities. Review of a Proposed Quarterly Coal Publication.
Jan 81, 107p
Contract AC01-80EI10313

This Review of a Proposed Quartery Coal Publication contains findings and recommendations regarding the content of a new summary Energy Information Administration (EIA) coal and coke publication entitled The Quarterly Coal Review (QCR). It is divided into five sections: results of interviews with selected EIA data users; identification of major functions of the coal and coke industries; analysis of coal and coke data collection activities; evaluation of issues conerning data presentation including recommendations for the content of the proposed QCR; and comparison of the proposed QCR with other EIA publications. Major findings and recommendations are as follows: (1) User interviews indicate a definite need for a compehensive publication that would support analyses and examine economic, supply and demand trends in the coal industry; (2) the organization of the publication should reflect the natural order of activities of the coal and coke industries. Based on an analysis of the industries, these functions are: production, stocks, imports, exports, distribution, and consumption; (3) current EIA coal and coke surveys collect sufficient data to provide a summary of the coal and coke industries on a quarterly basis; (4) coal and coke data should be presented separately. Coke data could be presented as an appendix; (5) three geographic aggregations are recommended in the QCR. These are: US total, coal producing districts, and state; (6) coal consumption data should be consolidated into four major consumer categories: electric utilities, coke plants, other industrial, and residential commercial; (7) several EIA publications could be eliminated by the proposed QCR. (ERA citation 06:022991)

Final Summary Report on an Analysis of Selected Energy Information Administration Publications.
1981, 8p
Contract AC01-80EI10313

This document summarizes work designed to provide the EIA Office of Energy Data Operations with a comprehensive analysis of selected EIA publications. The analysis includes recommendations for the replacement, elimination, or integration of forms, data series, data systems, data bases, and publications. It also suggests improvements in the content, format, and structure of an integrated publications series for selected major energy areas. Tabular and graphical tables documenting interrelationships between and among data elements contained in publications were developed and prepared. A description of the work performed to date is given and includes a summary of findings on: Electric Power Monthly (EPM); The Quarterly Coal Review (QCR); Review of the Proposed Quarterly Coal Review; Review of the Coal and Electric Sections in the Monthly Energy Review. Recommendations are summarized. (ERA citation 06:022989)

MAXIMA Corp., Bethesda, MD.
Review of the Proposed Quarterly Coal Review.
Apr 81, 41p
Contract AC01-80EI10313

This Review of the Proposed Quarterly Coal Review is the second of two reports and contains the results of our analysis of issues regarding the publication of a new summary publication, the Quarterly Coal Review. The first report on the QCR was submitted to the Office of Energy Data Operations (OEDO) in January 1981 and included results of our analysis and recommendations concerning data availability and content organization. This report concentrates on data presentation and publication format for the proposed QCR. Comprised of two sections, the report addresses chapter and table formats and presents a detailed analysis of chapter content. The first section of this report, Chapter, Table and Graph Formats, consists of findings and recommendations on the ordering, titling, end notes and cosmetics of the tables proposed for the QCR. The next section, Detailed Analysis of Chapter Content, is the result of a more in-depth analysis of chapters in the QCR. (ERA citation 06:022993)

MAXIMA Corp., Bethesda, MD.
Review of the Coal and Electric Sections in the Monthly Energy Review and an Overall Review of Office of Energy Data Operations Publications.
Apr 81, 126p
Contract AC01-80EI10313

This Review of the Coal and Electric Sections of the Monthly Energy Review and an Overall Review of OEDO Publications is comprised of two sections. The first, Review of Coal and Electric Power Data in the Monthly Energy Review consists of a detailed analysis of content and data presentation issues. The major findings of this section are summarized below: the coal and electric power data in the Monthly Energy Review (MER) represent the major functions of the respective industries; coal data by rank are inconsistently presented in the MER; coal value or coal cost and quality data are not adequately represented in the MER; the presentation of two or more units of measurement on the same table in MER may invite incorrect comparisons unless properly separated (e.g., - double line separation); to improve the timeliness of the data in the MER, the increased use of estimated, preliminary, and/or projected data should be considered; and the table and graphic formats used in the MER present the data clearly and concisely. The second section of the report, An Overall Review of OEDO Publications, contains the results of an analysis of data presentation in forty-six coal, gas, electric, oil and consolidated publications. A summary of our findings and recommendations is listed below: where practical, a scope of publication section and executive summary should be included in OEDO publications; table formats, in-

cluding titles and endnotes should be uniform; more detailed guidelines for titling should be established by the Energy Information Administration (EIA); and a more detailed set of standards for footnotes, notes and source notes should be established by EIA. (ERA citation 06:022994)

Modelling Summary Data.
R. R. Johnson. 1981, 18p CONF-810467-2
Contract W-7405-ENG-48
SIGMODE international conference on management of data, Ann Arbor, MI, USA, 29 Apr 1981.

Several problems in specifying aggregate functions in relational systems are investigated. A solution is proposed to these problems in the form of an extension of the relational data model. In particular the concept of summary data is introduced. The query language STRAND is presented in order to describe retrieval operations on the extended model. STRAND allows a user to formulate queries involving aggregate functions without conceptualizing the query in terms of aggregation. Two example applications, proposal tracking and socio-demographic data bases, are used to illustrate the concepts of the extended model. (ERA citation 06:022990)

The Uniform System of Home Health Agency Reporting: An Analysis of its Impact on Home Health Care Providers.
Gerald N. Siegel, Gary Homan, and J. Terry Flores. 30 Jun 80, 249p HCFA/PUB-03104
Grant HCFA-500-79-0013

The purpose of this study was to estimate the costs to implement and maintain the Uniform System for Home Health Agency Reporting (USHHAR). This study will provide information needed to revise the draft USHHAR and the data necessary for calculating the reporting burden when the system is ultimately revised. The identification of the areas of burden will be useful in reducing the scope of the reporting system, by identifying where incompatibilities exist.

The Research Application and Information (RA & I) Group's course on report writing is designed to help NITRR's authors become better writers by giving them straight-forward rules for better style, and by encouraging them to criticize and revise their own work. Topics to be dealt with include audiences, structuring, grammar and references. Also covered are certain NITRR and CSIR in-house rules which have been developed over the years.

Computer-Aided Management of Requests for Photocopies Received by a Documentation Centre: Annual Report and Statistical Interpretation of Results (Gestion des Demandes de Photocopies Adressees a un Centre de Documentation: Rapport Annuel et Interpretation Statistique des Resultats),
Alexandre Troieepolsky. 1980, 160p
Text in English and French.

The dissertation describes a method for studying, by computer, requests to information centers and libraries for technical literature. Details of the requests, such as periodical title, date of publication, source of supply, language, etc. are stored, counted, ranked and compared to allow annual assessment to be made of factors influencing the spread between various types of requests. In addition, facultative registering of (a) authors and title of documents offers both the editing of bibliographies and the generation of permuted indexes for information retrieval; and of (b) requests circulation transactions allows the follow-up of documents supply activities. New computer programs have been developed for these purposes and are explained.

Multitest, DVM-Based Data Acquisition System on an LSI-11/23, Running under RSX-11M.
D. H. Liston, W. M. McDonald, and S. D. Koopman. 30 Apr 81, 13p CONF-810546-2
Contract W-7405-ENG-48
1981 spring DECUS U.S. symposium, Miami Beach, FL, USA, 18 May 1981.

A digital voltmeter (DVM) based data acquisition system that allows multiple simultaneous tests to be conducted concurrently was designed. Using an LSI-11/23 and the RSX-11M operating system, the system acquires, displays, and stores data from strain gages, load cells, etc. Post-test data can also be routed via DECNET to another node of the network for archiving or analysis. To ensure that the system would meet the needs of the users, several design documents were created that were agreed upon by the designers and users before any software was written. This design strategy had several advantages, described in this paper along with the performance problems, hardware selection, and software design. (ERA citation 06:022985)

Local Economic Factors Affecting Navy First-Term Reenlistment.
Final rept.,
M. T. Cowin, F. E. O'Connor, and A. S. Rhode. 7 Oct 80, 122p Rept no. ISI-V-0521-02
Contract N00014-79-C-0155

The effects of local economic factors on an individual's decision to reenlist or extend were investigated for a cohort of four year obligors who enlisted between April and September 1974 using probit maximum likelihood estimation. The attractiveness of the civilian labor market both at an individual's home town and at his duty station was represented by measures of local unemployment and relative wages. Additionally, Navy reenlistment incentives and demographic characteristics of the individual were investigated. Results indicated that, for some mechanical and administrative ratings, unemployment at an individual's home town at approximately the time of first assignment to a permanent duty station had a positive influence on the likelihood of remaining beyond the completion of a first term. Relationships between local labor market conditions and reenlistment behavior were generally weaker than the relationships observed between national economic conditions and reenlistment in previous studies. Promotion and reenlistment bonuses were shown to have a strong positive impact on the retention of all occupational groups. (Author)

The DYNEVAL (Dynamic Economic Values) Model. Volume I. A Generalized Overview,
George E. Pugh, Max T. Nunenkamp, and Joseph C. Krupp. May 81, 54p Rept no. DSA-306-VOL-1
Contract AC00c104
See also Volume 2, AD-A100 897.

The first volume summarizes the basic design structure of the model; including the constraints; the economic objective function; the optimization methodology; and the basic mathematical formulation. DYNEVAL is a national economic model in which the underlying decision processes are governed by a dynamic balance of value considerations as these considerations are reflected in the power structure of the economy. Whereas most national economic models are designed to project short term trends or business cycles in the normal operation of an economy, DYNEVAL is designed to provide a fundamental assessment of the effect of major economic disruptions on the operation of an economy. Given a major disruption (such as a drastic change in the level of defense expenditures, a cut-off in oil imports, the loss of foreign markets, or the destruction of production facilities), the model shows how capital investment and production resources can be allocated within the economy to mitigate the resulting economic damage; and it provides an assessment of the overall economic impact, assuming an efficient allocation of resources within the economy.

Adding Asymmetrically Dominated Alternatives: Violations of Regularity & the Similarity Hypothesis.
Technical rept.,
Joel Huber, John Payne, and Chris Puto. Jul 81, 38p Rept no. TR-81-2-ONR
Contract N00014-80-C-0114

An asymmetrically dominated alternative is one that is dominated by one item in the set but not by another. It is shown that the addition to a choice set of such an alternative can increase the probability of choosing the item that dominates it. This result points to the inadequacy of many current choice models and suggests product line strategies that might not otherwise be intuitively plausible. (Author)

Also available in set of 3 reports PC E06, PB81-216277.

This is a study of the role of information goods and services in trade with emphasis on merchandise trade. Industries included in the information sector are specified and the relative significance of merchandise and services in this sector are estimated.

The study compares the comparative performance and relative significance of trade in the merchandise of information industries with merchandise trade in general; it compares trade performance of information merchandise that relies on conventional technologies with that which relies on newer technologies; an analysis is made of exports as a percentage of industry output for a number of industries. There is a discussion on the regional distribution of trade for selected industries.

Assessment of U.S.-Indian Science and Technology Relations: An Analytical Study of Past Performance and Future Prospects.
Final rept.,
Ward Morehouse, Brijen K. Gupta, and Anil Deolaliker. c1980, 256p CIPA-80/01
Contract NSF-INT77-26001

For India and the United States, the consequences of their 30-year relationship in science and technology have been mixed. India has made significant progress toward its goal of becoming a major world industrial power, of which a substantial national capacity in science and technology has been perceived by Indian leaders and planners as an essential ingredient. But its socio-economic goals of greater equity and less poverty have remained largely unfulfilled. The US has made a significant contribution to the growth of the modern sector of the Indian economy through both government-supported science and technology programs and private sector technology flows, although the primary effort has been Indian, not foreign. This has enabled the US to maintain a modest measure of policy influence. But realizing the equity goals of the 'new directions' in US economic policy toward developing countries which emerged in the 1970s has been as elusive for the US in its relations with India as for India itself. For the future, US-Indian science and technology relations offer greater scope for genuine cooperation between two less unequal partners and an arena for increasing conflict as India's industrial capacity becomes more directly competitive with the US.

Interest Rate, Transaction Costs and Financial Innovations.
Paper no. 13,
V. V. Bhatt. 1979, 44p AID-PN-AAH-358
Contract AID/ta-BMA-7
International Conference on Rural Finance Research Issues (2nd) held at Calgary, Canada on August 29-31, 1979.

Fragmentation of the capital market, that is, the phenomena of different markets for different products, as it occurs in the LDCs is generally attributed to high interest rates. The crucial variable in determining these rates is transaction costs (both administrative costs and default risk). Financial innovations (changes in production and consumption functions, introduction of new goods and services, changes in organization and market forms, etc.) reduce these costs and thus lower interest rates. The author gives a number of examples and emphasizes the need to move away from the usual discussion of interest rates based on factless theorizing and the macro approach to monetary and banking analysis.

A Review of Inputs and Impacts of Coal-Based Synthetic Fuel Plants.
Staff rept.,
Thomas H. Shillington. Feb 81, 41p AGESS-810202

The report assesses published estimates of the inputs and local economic impacts of proposed coal-based synthetic fuel plants, and identifies gaps in assessment informational requirements. It concludes that the nature and magnitude of local economic impacts cannot be predicted accurately using available data. First, the few published estimates of synthetic fuel employment requirements and schedules often are out-of-date or contradictory. Second, growth management strategies for energy boom towns have not been adequately evaluated. Third, conventional assessments may not identify substantial structural changes in small rural economies undergoing rapid growth from sustained energy development. Finally, uncertainty -- about plant lifetimes and the settlement decisions of newcomers -- remains an important variable.

Rept. for Jan 74-Jul 81.
Jul 81, 70p

This bibliography contains citations concerning the business of the motion picture industry. Upper management is discussed, and the diversification of many of the film companies is mentioned. The economics aspects of the industry, are noted, and mergers and the use of films as tax shelters are considered. (Contains 96 citations fully indexed and including a title list.)

Distribution Channels for Marketing of Consumer Goods. January, 1976-July, 1981 (Citations from the Paper and Board, Printing, and Packaging Industries Research Associations Data Base).
Rept. for Jan 76-Jul 81.
Jul 81, 76p

A partnership in distribution between manufacturers and retailers is considered in this bibliography from global sources. Topics discussed include effective grouping of customers, products, order sizes, territories, and stability factors in industrial marketing channels. (Contains 45 citations fully indexed and including a title list.)

Department of State, Washington, DC. Office of External Research.
Iran's Foreign Policy,
R. K. Ramazani. Mar 81, 12p FAR-30029
Prepared in cooperation with Virginia Univ.

This paper will outline five sets of questions on the current foreign policy of the revolutionary regime in Iran. These include foreign-policy decision-making; the Iraq-Iran war; Iran-Soviet relations; U.S.-Iran relations and the overall direction of Iran's foreign policy. None of these can be probed in depth here, but salient features of each will be summarized on the basis of my oral presentation to the Department on March 10.

The United States, Vietnam, and the National Interest.
Master's thesis,
John G. Karas. Mar 81, 246p

The purpose of this thesis is to assess the interests of the United States towards Vietnam from FDR to Carter; to trace the development of U.S. policies towards Vietnam under these presidencies; to define the issues in the current relationship

between the two nations; and to set forth a strategy based on the political, economic and military needs of all the regional actors: the United States, Vietnam, China, ASEAN (Thailand, Malaysia, Singapore, Indonesia, and the Republic of the Philippines), Japan and the Soviet Union. (Author)

Minnesota Business Licensing Study: A Report to the Minnesota State Legislature,
Charles A. Schaffer. Jun 81, 429p EDA-81-091
Grant EDA-06-06-01666-40

Problems associated with state licensing regulation have been both federal and state concerns. The passage of the Environmental Coordination Procedures Act provided a statutory initiative for improved coordination of licensing and permitting and for direct service and assistance to those seeking environmental permits. Minnesota businesses and the activities of other states the Minnesota legislature recognized that a problem might exist in the number, kind, and procedures of licenses and permits necessary for the start-up, operation and expansion of a business. That recognition resulted in the passage of Chapter 246, requiring the Department of Economic Development to conduct a comprehensive study of state licenses and permits for operation of a business. The study has had four major goals. Collection, organization, identification, recommendation and development for legislative consideration of proposed statutory language to implement the recommendations made.

Should We Cut Our Losses. U.S. Foreign Policy and International Regimes. Donald L. McKernan Lectures in Marine Affairs, October 15-16, 1980.
Joseph S. Nye. c1981, 49p WSG-81-2, NOAA-81042905
Grant NA79AA-D-00054

The politics of the oceans have grown increasingly complex in this century and along with that complexity has come regime change. Can the United States as a great power afford to turn its back on a major ten-year effort at international regime definition. Thus, the question in the title, should we cut our losses. The author deals with this issue first in relation to the specific problems of the law of the sea regime, then explores a contrasting case--international oil--where an international regime has broken down and conference diplomacy has been suggested as a remedy. He then explores a case where a favorable but eroding regime for the nonproliferation of nuclear weapons has been bolstered by a type of conference diplomacy.

Surveys of Lighting and Working Conditions in Submarine Sonar Shacks.
Interim rept.,
Jo Ann S. Kinney, S. M. Luria, David F. Neri, Scott W. Kindess, and Christine L. Schlichting. 9 Jun 81, 13p Rept no. NSMRL-955

A survey of the physical, working conditions of twelve operating submarines was completed. The purpose was to determine the range of conditions normally encountered in sonar shacks. These conditions will next be assessed for their effects on performance and comfort so that optimum conditions can be specified. The results showed a great diversity of illumination, both in color and quantity, on the various sonar systems. Effective levels of illumination are generally considerably higher under blue light than under red. While the duty-cycle of six hours on and 12 hours off watch was standard, rotation periods during watch varied. Several conditions within the sonar shack could be changed to improve working conditions. (Author)

KC-135 Crew System Criteria.
Final rept. 5 May-1 Nov 80,
John H. Kearns, Ralph Madero, and Keith Burnette. Mar 81, 230p AFWAL-TR-81-3010
Contract F33615-79-C-3030
Prepared in cooperation with Bunker-Ramo Corp., Westlake Village CA, F33615-78-C-3614. and ORLOC, Kettering, OH. 2nd edition.

This document presents design criteria for the KC-135 Crew Systems to be developed under the KC-135 Avionics Modernization Program. It summarizes the objectives, requirements and costraints of the Strategic Air Command (SAC) (as embodied in the KC-135 Avionics Modernization Program) which have potential impact upon crew system requirements or which serve to put crew system activities in proper perspective. A methodical detailing of requirements and criteria for the crew system is presented, as well as a tracing of the logic by which they are derived from the intended mission, from the overall Weapon system and from the subsystem capabilities and needs. Additional detailing and constraints have been derived from behavioral data and pilot factors considerations elicited in experimental programs utilizing dynamic mockups, simulation and flight test. A testing procedure is described for determing degree of compliance with requirements and criteria.

Archeological Investigations at the Graham Site, 34-At-90, 1975, 1977, and 1978.
Final rept. Apr 77-Apr 81,
Charles D. Cheek, Susan Bearden, Wayne Young, C. Britt Bousman, and Steven Hackenberger. Apr 81, 409p RR-23
Contract HCRS-C3552(76)

In March of 1977, Archeological Research Associates, Tulsa, contracted with Interagency Archeological Services, National Park Service, to excavate the Graham Site, 34-At-90. This site was to be inundated by the United States Soil Conservation Service impoundment. Unfortunately, prior to completion of contracting arrangements, the impoundment was completed and the site partially flooded, which severely diminished the research potential of the site. This report discusses material excavated during earlier research at the site, which was subsequently analyzed in more detail. The main portion of the report is devoted to the integration of the information gathered by the 1978 excavations at the site with the reanalysis of the 1975 material.

Hand Tool Vibration and Vibration Energy Transmitted to the Hands of Pneumatic Chipping Hammer and Pneumatic Grinder Operators During Foundry Casting Cleaning Operations.
Contract rept. (Final),
Douglas D. Reynolds, and Richard A. Basel. 28 May 80, 350p NIOSH-210-77-0165
Contract PHS-NIOSH-210-77-0165

The transfer of acceleration and energy from vibrating tools to operator's hands was investigated. Average values of amplitude and phase of tool energy were measured in a range of 6.3 to 1000 Hertz (Hz) for 75 workers, and acceleration was measured for chipping hammers and grinders. The tool energy was below 80Hz. Acceleration of chipping hammers exceeded exposure limits proposed by the International Organization for Standardization while grinders were within those limits. The authors conclude that larger handles give lower values of displacement mobility.

Houston Univ., TX. Dept. of Psychology.
A Model of Discipline in Organizational Settings.
Technical rept.,
Richard D. Arvey. Jun 81, 22p Rept no. TR-1
Contract N00014-80-C-0541

The report details the results of the first phase of a large scale research study investigating discipline and the effects of discipline in a large Southeastern Oil Refinery. The fifty seven interviews were conducted with hourly maintenance and operating employees. Based on these employees' descriptions of the discipline process and how it works, a preliminary model was developed. Variables associated with the employee, the disciplinary agent, the situation, and the refinery complex as a system were specified as being potentially influenced in the disciplinary process. New Training Realism for B-52 Crews.
Research rept.,
Bruce E. Eickhoff. May 81, 25p Rept no. ACSC-0780-81

Increasing defensive capabilities of potential enemies have required significant changes in the Strategic Air Command's mission and training philosophy since the mid-1970s. Specifically, the command has stepped up B -52 participation in a variety of exercises to improve readiness in both the nuclear and nonnuclear missions. The author discusses the SAC training program in some detail to show how changes in philosophy insure that the aging B-52 will be a viable weapon system during the 1980s. (Author)

Effects of Presentation- and Test-Trial Training on Acquisition and Retention of Movement End-Location.
Technical rept.,
Joseph D. Hagman. Nov 80, 32p Rept no. ARI-TR-492

Three groups of 15 governmental employees performed three training trial cycles consisting of six trials each. Training methods differed in emphasis on presentation (p) and test (t) trials performed during each cycle. For one group, a cycle consisted of three p- and three t-trials administered in alternation. For another group, the first five trials of each cycle were p-trials and the sixth was a t-trial. For the last group, the first trial was a p-trial and the next five were t-trials. Group acquisition performance was compared at the last trial of each training cycle, while retention was compared 3 minutes and 24 hours after acquisition. Absolute (unsigned) error revealed that final acquisition was better when training emphasized p-trial repetition or p- and t-trial alternation within cycles. Long-term retention was better when training emphasized t-trial repetition. It was concluded that testing is an effective way to improve long-term retention of motor skill and that improvements could be realized by changing the emphasis of training from presentation to testing. This could be done without added training resource expenditures.

Structural Change in the U.S. Army.
Final rept. 15 Jul 77-30 Sep 79,
David R. Segal. Dec 79, 10p ARI-RN-81-2
Grant DAHC19-77-G-0011
See also Rept. no. ARI-RN-79-23, AD-A079 763.

A series of theoretical and empirical analyses were undertaken to determine changes in the structure of military organization, the nature of military service, and the relationship between military organization and society since the advent of the all-volunteer force. We found that the structure of job-related attitudes among soldiers in the 1970s is similar to that among soldiers in the 1940s. The level of satisfaction, however, is lower today than it was during World War II. As was the case in World War II, black junior enlisted men today have somewhat higher job satisfaction than do white junior enlisted men. Military personnel in the all-volunteer force define what constitutes a good job much like their civilian counterparts. Thus, military service has become a job as well as a calling to many. This fact is also reflected in the attitudes that high school seniors have toward military service, with notable variations on the basis of gender and of race. Many of the traditional linkages between the military establishment and American society have been disrupted by the ending of conscription and the advent of the all-volunteer force, and there is evidence that career personnel retain few ties to the civilian community.

First-Tour Attrition: Implications for Policy and Research.
Final technical rept.,
Barry E. Goodstadt, and Nancy C. Yedlin. Jun 80, 66p ARI-RR-1246
Contract DAHC19-77-C-0041

Current high levels of early personnel attrition are costly to the Army in terms of both recruiting and training requirements. This paper reviews state-of-the-art developments in research on attrition across the services. Past research has characterized the causes of attrition as within the individual who is discharged, in the nature of the organization's policies and practices, or different factors at different times during first enlistment. Consistent links have been found with individuals' characteristics, such as age and education, and with organizational policies. Future research should define and evaluate procedures for effective management of attrition. Specific research should be focused on areas where existing research seems to apply to policy. For example, attrition prediction tools may be applied to influence the Army's accession policies, or research findings may be utilized for developing training programs for line supervisors or may suggest ways of controlling attrition timing and tradeoffs during first enlistment. Effects of Down-Range Feedback and the ARI Zeroing Target in Rifle Marksmanship Training.
Research rept.,
Seward Smith, Thomas J. Thompson, Keith Evans, Arthur D. Osborne, and Jeffrey L. Maxey. Jun 80, 53p ARI-RR-1251
Contract DAHC19-77-C-0011

Techniques were developed to provide knowledge of down-range rifle marksmanship results and to improve and simplify the process of zeroing the M16A1 rifle. These techniques were tested in a field experiment utilizing 2,124 basic trainees undergoing basic rifle marksmanship training at Fort Jackson, S.C. Among male trainees, those who received either the ARI Zeroing Target of Down-range Feedback training were superior in their record fire scores to trainees in the control condition. Those receiving both ARI treatments were the best of all, showing a 12.3% performance hit increase over controls. Female trainees did not show these results, but there appears to have been non-comparable samples among the four groups of women. In general, males in all groups had higher record fire scores than females. Questionnaire data revealed that trainees who received the ARI Zeroing Target training were more knowledgeable about zeroing than were controls. Overall, however, trainees demonstrated poor knowledge of many marksmanship fundamentals. These findings have been incorporated by the U.S. Army Infantry School and ARI in the development of an improved BRM training program soon to be implemented Army-wide. (Author)

Job Samples as Tank Gunnery Performance Predictors.
Technical rept.,
Newell Eaton, Jimmy R. Johnson, and Barbara A. Black. Sep 80, 67p Rept no. ARI-TR-473

This research was conducted to develop and evaluate job samples as predictors of tank gunnery performance. In Phase I of the research two potentially useful job sample predictors were identified and validated. Phase II results provided cross-validation of these predictors. Subjects in Phases I & II consisted of recent Armor OSUT graduates. Approximately one-half the subjects in Phase III were administered the job sample tests during their eight week of training while the remaining one-half were tested at the Fort Knox Reception Station, i.e., prior to training. Phase III results demonstrated that feedback had no effect on job sample-tank gunnery relationships; however, level of prior training did have an effect. Eight week personnel performed at a higher level than Reception Station personnel on most job sample tasks. Results suggest that the job samples evaluated here offer promise in predicting performance after initial training and may be adaptable for use with the operational unit assignment process. (Author)

The Effects of Repeated Engagement Simulation Exercises on Individual and Collective Performance.
Technical rept.,
Robert H. Sulzen. Aug 80, 29p Rept no. ARI-TR-485

This research measured individual and collective tactical performance in a series of engagement simulation exercises against novice opponents and with the same mission and terrain. The effects of engagement simulation training have been difficult to measure since training normally has been conducted with varying missions and terrain against a constantly improving opponent. The results of this research indicate that collective tactical performance is improved by repeated engagement simulation exercises. In the specific conditions tested, rifle squad members defending against a series of 15 rifle platoons in a movement-to-contact mission tended to suffer increased casualties when they caused more casualties. Squad members varied considerably among each other in terms of casualties produced. The squad collectively improved over time in their rate of producing enemy casualties, but did not improve in avoiding enemy fire. The squad collectively inflicted more casualties from some defensive positions than would be expected by chance. (Author)

Trainee & Instructor Attitudes Toward One Station and Two Station Initial Entry Training.
Final rept. Jul 75-Aug 76,
Tomme R. Actkinson. Feb 80, 35p Rept no. ARI-RR-1243

Trainees and instructors were queried as to their attitudes toward two initial entry training strategies (IET). The two training strategies employed were One Station Unit Training (OSUT) and Two Station

Training (TST). OSUT was conducted solely at Ft. Benning, Ga. TST was conducted at two locations with the first seven weeks of training at Ft. Knox, Ky. and the last five weeks at Ft. Benning, Ga. Analysis of results showed that TST trainee attitudes improved throughout training, and that by the end of IET TST trainees had significantly more positive attitudes than did OSUT trainees. Instructor results were mixed. However, OSUT instructors indicated they felt that the length of time between cycle breaks was too long. (Author)

Ethics and the Military Profession. Sports and the Military,
James L. Narel. Jan 80, 16p

The similarities between athletic competition and combat have been frequently cited by both military and sports figures. The labels used in one activity have become metaphors in the language of the other. But while the parallels are frequently obvious and undeniable, arguments are sometimes made that pursue the analogy into areas of questionable application. While both are physical, competitive activities, an athletic contest, however grueling or punishing, is not war; and war, obviously, is never simply a game. The feature article addresses the connection between sports and war and, more specifically, the focus on winning in each activity.

Military Academy, West Point, NY.
Ethics and the Military Profession. Values and the Professional Soldier,
James L. Narel. Mar 81, 9p

A rule of thumb governing polite conversation is to avoid topics, such as religion and politics, that deal with personal values since the resulting arguments are usually inconclusive and sometimes volatile. But that such discussions frequently bog down is not evidence that rational inquiry in this field is impossible. Reasoned analysis about personal and professional values can help us to be more rationally aware of the motives behind our actions, to identify possible inconsistencies in our moral outlook and to develop, in a gradual and systematic way, a more sophisticated work view. The feature article that begins overleaf and the events listed below offer opportunities for this kind of personal and professional growth. (Author)

A Simulation to Analyze Pilot Workload in an Electro-Optical, Night, Low-Level Environment.
Master's thesis,
Anthony W. Groves, and Richard L. Kaercher. Mar 81, 195p Rept no. AFIT/GST/OS/81M-5

As new equipment is developed for fighter aircraft, new mission profiles are often developed. One method of evaluating the change in pilot workload associated with this new equipment is the development of a man-machine simulation that will allow workload comparisons. This thesis undertakes the development and application of such a model. The model developed and used in this study is a time sequenced network of required tasks with priority servicing by a single server. Monte Carlo techniques are used to induce a randomness into the profile to represent the variation between individual missions and pilot techniques. The major parameters in the model are the flight control service times, frequency of flight control task initiation, and the frequency of defensive reaction task initiations. The model incorporates twenty different tasks in a mission profile simulating thirty minutes of night tactical low level navigation using an electro-optical device for visual navigation and terrain following.

Journal of Dental Education: Manual for Development of General Practice Residency Programs in Dentistry.
Jun 79, 97p
Contract PHS-HRA-231-77-0059

This manual is designed to help institutions initiate, improve, or expand general practice residency programs in dentistry. The manual is divided into three major sections. The Introduction (Section I) reviews the historical background of general practice residency programs. Section II is entitled, 'Organization and Development of General Practice Residency Programs.' In it six areas are identified that should be considered before a new program is developed. In Section III three areas of instruction in general practice residency programs are identified. One section deals specifically with inhospital training and medical assignments. Each section begins with a brief introduction to explain the significance of the chapters. Chapters begin with a statement of objectives, so that the reader will know what should be learned from the chapter. The contents of the chapters are straight-forward descriptions of the material required for starting or improving a genral practice residency in dentistry, regardless of size, location, or history.

Sep 80, 63p

Training opportunities for participants in the Orange County Health Planning Council (OCHPC) are identified and formalized. The goal of the orientation program is to enable each new OCHPC participant to understand and to communicate the functions and responsibilities of OCHPC, the organization and structure of OCHPC, the roles of volunteers and staff, the history of health planning, and the major trends in the health care system. The training program builds upon the basic knowledge obtained in the orientation program and is tailored to meet the needs of the specific roles performed within the agency. Definitions, goals, objectives, and resources are provided for the orientation program and for the following training programs; the Board of Directors, Administrative Committees, Appropriateness Review Committee, Health Facilities Review Committee, Data Management Technical Advisory Group, Plan Development Committee and Planning Task Forces, Implementation Committee and Planning Task Forces, Implementation Committees and Task Forces, Community Services Committees, and Assembly of Delegates. Eight guidelines are listed for planning training sessions. Although the evaluation format will vary according to the objectives and type of training performed, a sample of a subjective evaluation form is included. The appendices include an Orientation and Education Interest Survey (checklist format) and a Meeting and Travel Authorization Form.

Regional Dental Education Program (RDEP). Phase I Implementation Report,
Rept. for 24 Aug 79-1 Sep 80.
1 Sep 80, 228p
Contract PHS-HRA-232-79-0069
Portions of this document are not fully legible.

The prototype program represents a research effort to investigate the Regional Dental Education Program (RDEP) as an alternative to new dental school construction or dental school enlargement. This alternative involves utilizing already existing educational resources and facilities in states without dental schools to provide portions of dental education. The purpose of the present program is to demonstrate and evaluate a system of regionalized dental education.

Washington Univ., Seattle.
Prototype: Regional Dental Education Program (RDEP). Executive Summary.
Implementation rept. on phase 1, 31 Aug 79-27 Oct 80.
1980, 8p
Contract PHS-HRA-232-79-0069

The prototype Regional Dental Education Program (RDEP) represents an effort to investigate one al-

ternative to new dental school construction or dental school enlargement. This alternative involves utilizing the resources of an existing dental school (Central University) in one state in combination with existing facilities in other states (Satellite University) without dental schools. This alternative will develop a cost effective and cost competitive method of providing dental education to students from states without a dental school without increasing the total dental school enrollment. This alternative enables the provision of portions of dental education in geographic areas that are removed from a parent dental school. The purpose of this project is to demonstrate and evaluate a prototype system which can be used as a model in other locations.

Effect of Education on Drug Utilization: Executive Summary.
Final rept.,
Thomas C. Meyer. Feb 81, 109p NCHSR-81/141
Grant PHS-HS-03985

The use of several drugs in a university hospital was studied. The purpose was to determine if some educational techniques would be better than others to improve prescribing habits or if physician prescribing patterns for some types of drugs were more easily changed than their patterns for other types of drugs. Only one of the drugs studied varied from the accepted and acceptable use significantly enough to warrant educational intervention. The educational techniques used improved prescribing practices for this drug significantly. Cost/benefit could not be calculated because there were so few variations from the accepted and acceptable use criteria for the drugs studied. Possible reasons for this are discussed.

Faculty Salaries, Tenure and Benefits, 1979-80.
Annual rept. 1979-81,
Carolyn R. Smith. Sep 80, 79p NCES-81-348

The report is based on data collected in the survey of salaries, tenure and fringe benefits of full-time instructional faculty, a component of the Higher Education General Information Survey. Conducted for the academic year 1979-80, the survey collected data on salaries, tenure and fringe benefits of full-time instructional faculty by sex, academic rank, length of contract, and level and control of institutional unit. Faculty covered were employed as of October 1 of the survey year. They were limited to members of the instruction/research staff employed on a full-time basis whose regular assignment was instruction, including those with released time for research. Excluded were pre-clinical and clinical faculty, faculty who contribute their services, faculty on other than 9- and 12-month contracts, and faculty on leave without pay. Excluded also are administrative officers such as Dean of Faculty, etc., even though they devote part of their time to classroom instruction. Undergraduate and graduate students who assist in instruction and have titles such as teaching assistant or teaching associate are also excluded. Includes tables comparing data from previous years.

Employment Projections in Puerto Rico Through the 1980's: A Structural Analysis,
Final rept.,
Richard Weisskoff. Jun 81, 57p DLETA-91-19-77-31-1
Grant DL-91-19-77-31
Color illustrations reproduced in black and white.

The study traces the changes in employment in Puerto Rico from 1940 to 1980, and relates the observed changes to the economic structure and development strategy. An analysis of the changes in the farm sector from 1950 to 1978 reveals the decline of three crops (sugar cane, coffee, and tobacco) and the parallel demise of the labor intensive food crops (plantains, root crops, citrus, and legumes). The extension of the U.S. Food Stamp program to Puerto Rico in 1975 is cited as both the cause for the recent decline of native food production and as the income supporter for the inactive and unemployed. The author outlines a food self-sufficiency program for Puerto Rico based on existing studies by the U.S. Department of Agriculture.

Civil Servants and Contract Employees: Who Should Do What for the Federal Government.
Rept. to the Congress.
19 Jun 81, 50p FPCD-81-43

Federal agencies use contractors to do work that GAO believes Federal employees should do because the work involves basic management decisions. Although contractors may not be making final decisions, GAO is concerned about the extent to which contractors are influencing agencies' control of Federal programs and policies. Ironically, while Federal agencies use contractors for work that should be done in-house, they use Government employees to provide commercial services that contractors could provide in many cases at a lower cost. GAO recommends that the Congress and the Office of Management and Budget improve oversight and management of the Federal contract work force.

Jobs for Women in Rural Industry and Services,
Ruth B. Dixon. Jul 79, 60p AID-PN-AAH-490
Contract AID/otr-147-79-52

Increasing landlessness in combination with other economic and demographic forces has created a compelling need in most developing countries for the expansion of nonagricultural employment in rural areas. Because women tend to be particularly vulnerable to displacement from land and from tranditional income-generating activities by the commercialization of agriculture for cash crops and by investment in capital-intensive industries, policies of agrarian reform and rural development will need to design support systems to: raise the productivity of labor in which rural women currently engage; transform subsistence activities into income-generating activities; and create new employment opportunities for women, particularly outside of agriculture. This paper provides new statistics on female labor in 56 countries; and proposes strategies for mobilizing rural women for employment.

The Role of Marine Science in the Biology Classroom,
Lloyd E. Story, Jr. Oct 80, 8p MASGP-80-018, NOAA-81042914
Grant NA80AA-D-00017
Presented at the National Association of Biology Teachers Annual Convention in Boston in October, 1980. Prepared in cooperation with University of Southern Mississippi, Hattiesburg.

Curricular materials for use in secondary science classes are described. The materials are intended to be supplemental marine education materials that can be incorporated into existing secondary courses. It is invisioned that teachers will review the materials and find them interesting enough to try some or all of them in their courses at the proper time. The 'Man and the Gulf of Mexico' marine education materials will be field tested beginning with the fall term of the 1980-81 school year. There will be test centers in both states and the materials will be tested in inland as well as coastal schools. The students being exposed to the marine materials will be evaluated and statistical analyses will be determined.

Grant AID/ta-G-1421

Labor is a key resource in the developing world in the semiarid tropical (SAT) regions, where more than 500 million poor eke out a living. The purpose of this study was to determine the effect of newly developed land, water, and crop management technologies on existing labor patterns in a SAT region, in this case peninsular India. The performing organization based its study on six villages, detailing the use of family and hired labor by 30 farmers in each village. Topics covered in this report include labor patterns and the size of the farm, composition of labor, seasonality of labor use, regional labor patterns, and labor patterns with the introduction of watershed-based technologies.

Occupational Differentiation by Sex: An International Comparison.
Final rept. 1 Apr 78-31 Mar 80,
Katharine Alison Gaskin. 1979, 287p DLMA-91-26-78-26-F
Grant DL-91-26-78-26

Occupational segregation by sex is high in the United States, and evidence suggests that workers are sexually segregated in all industrial countries. However, no detailed cross-national comparisons of the phenomenon have been made. In this research the author has two aims. First, to compare the differentiation of women and men in detailed occupations in the United States, Canada, England, Norway, Sweden, West Germany and Italy. Reclassifying occupation data from 1960/1961 Censuses into a standard, comparable structure encompassing 86 occupations, the author estimates overall sex segregation and identifies sex-typed (sex-labeled) occupations. Second, the author explores causes of variation in occupational segregation. Within the limitations of Census data, the author explores supply-oriented and demand-oriented explanations.

Development of a Procedure for Examining Trades and Labor Applicants for Promotion to First-Line Supervisor.
Personnel research rept.,
Daniel B. Corts. Dec 80, 34p PRR-80-32

The Office of Personnel Management has developed a procedure for using a critical incident-based supervisory problems test, self-ratings of ability, and supervisory ratings of ability in ranking applicants for promotion to first-line Federal trades and labor supervisory positions. The procedure incorporates many research findings covering supervisory behavior and provides a systematic method for combining job-related information into a final score that can be used to identify the best qualified applicants. A job element analysis is used to select the most relevant subelements from a pool of 31 subelements describing the trades and labor supervisory domain. The scoring procedure provided combines the judgments of two subject matter experts serving as evaluators of all evidence of applicants' ability who know firsthand the requirements of the supervisory position to be filled.

Biographical Questionnaires and Scored Application Blanks in Personnel Selection.
Personnel research rept.,
Paul van Rijn. Dec 80, 28p PRR-80-31

The report provides a description and overview of biographical questionnaires and scored application blanks, and provides an evaluation of these procedures as potential alternatives to traditional written tests for personnel selection. A review of the literature, mostly from the private sector, shows that the biographical questionnaire has consistently proved to be one of the best single predictors for a broad spectrum of criteria and for a wide variety of jobs. However, concerns in the public sector about the job-relatedness, invasion of privacy, long-term validity, fakability, generalizability, and adverse impact of biographical questionnaires suggest that more research is needed and that their greatest potential in the public sector may be in post-employment placement rather than in personnel selection. Scored application blanks have been used extensively and successfully for personnel selection, both in the public and private sectors, and have proved to be useful selection devices. However, research is recommended to document their validity, reliability, and level of adverse impact.

Manpower and Training Model for the Mining Industry.
Contract research, 1 Jun 75-Apr 80,
David Siedenstrang, Dwight Ellingwood, and John Short. Apr 80, 219p BUMINES-OFR-92-81
Contract J0357109

The report was prepared to illustrate a model for projecting employment and training demands in the coal mining industry. The report details a methodology developed to translate forecasts of regional coal production and mining productivity into estimates of training incidences necessary to meet both the MSHA safety regulations and internal skills training demands. The model is responsive to estimates of employment turnover and the job mobility of the coal mining work force as configured from a summarization of job histories of approximately 15,000 miners collected during a mine site assessment of 47 coal mining operations located thoughout the Nation. In addition, historical production, productivity, and employment data are examined for the metal and nonmetal mining industries and projections of safety related training demands are presented.

The Development of Generalizable Work Behavior Categories for a Synthetic Validity Model.
Personnel research rept.,
Alice N. Outerbridge. Jan 81, 40p PRR-81-1

A study was conducted to develop a list of generalizable work behaviors for ultimate use in a modified application of Primoff's J-coefficient technique. A list of occupation-specific duties was constructed covering 24 highly populous Federal occupations, and a method was developed to inspect these duties for commonalities in terms of work behaviors. Using definitions in the Dictionary of Occupational Titles, researchers compiled a list of 223 duty statements, each of which was placed on a separate card. The duty statements were then sorted into categories describing similar work behaviors; first by a group of ten personnel psychologists and later by a group of ten occupational specialists. Nineteen sorters provided useable data. The 19 separate sorts were compared and summarized after transformation into matrix form, matrix representation allowing the development of final categories by cluster analysis as well as quantitative comparisons of sorters. Cluster analysis of the combined group categories yielded a total of 32 generalizable work behaviors.

Evaluation of a Manikin Psychomotor Task.
Final rept. Jan-Oct 80,
David C. Reader, Russell A. Benel, and Alton J. Rahe. May 81, 27p Rept no. SAM-TR-81-10

A small, self-contained microprocessor displays a manikin on a TV screen in various orientations. Subjects are required to choose lateralities depending on a shape also presented on the display, and performance (accuracy and reaction time) is automatically recorded. This task has been evaluated at the USAF School of Aerospace Medicine. Data are presented to show that the task is simple to use, can be learned by all subjects, and that plateau performance can be quickly established. The various presentations were examined for difficulty; subjective and objective measures of performance were compared, and repetitive effects were sought with similarities of presentation in sequence. The analyses showed that control performance with this task was essentially constant over the experimental period. (Author)

Further tests of Aspiration Level Effects in Risky Choice Behavior.
Technical rept.,
John W. Payne, Dan J. Laughhunn, and Roy Crum. Jul 81, 22p Rept no. TR-81-1
Contract N00014-80-C-0014
Availability: Microfiche copies only.

This note extends the work on the need to incorporate a target return, reference point, or aspiration level concept in the analysis of risky choice behavior. Two experiments are reported. The first experiment provides a more complete test of the model of reference point effects previously developed. A translation of outcomes procedure, which adds a constant to all outcomes, was use to vary the relationship of pairs of gambles to an assumed target or reference point. The results fully support the model. The second experiment provides evidence of the conceptual validity of the model by using explicit instructions to vary the target levels of managers, while holding gamble values constant.

Formal versus Situational Models of Expert Decision-Making.
Final rept. 1 Apr 79-31 Mar 81,
Stuart E. Dreyfus, and Huber L. Dreyfus. Apr 81, 11p AFOSR-TR-81-0539
Contract F49620-79-C-0063

After studying the skill acquisition process of pilots, automobile drivers, nurses, chess players, musicians, foreign language learners, and business managers, we have constructed a five-stage model describing the development of their skills. Briefly, performers at the first stage of development (novices) learn to context-free features and to use strict rules to determine actions. As they accumulate enough experience to become advanced beginners, performers identify, and relate by rule, features of the situation which are no longer context-free but are recognized as similar to previously experienced features. At both of these stages, the performer treats all feature as equally important. At the third level of skill, competence, the performer learns to organize a situation by consciously choosing a goal. The choice of a goal entails that different features have different degrees of importance, thereby establishing a perspective. Decisions are chosen which further goals. After yet more experience with many concrete situation, a very important transformation occurs. On the basis of expectations and immediately preceding experience, whole situations present themselves to a perficient performer with only their salient features manifest. No longer does the performer consciously select a perspective from among alternatives. The performer chooses an action on the basis of rules operation over salient features of the manifest perspective. Finally, the expert performer has somehow stored such a wealth of experience that the appropriate action simply springs to mind.

Task Accomplishment in an Air Force Maintenance Environment.
Final rept.,
William D. Kane, Jr. Feb 81, 80p AFOSR-TR-81-0478
Grant AFOSR-80-0146

This research investigated the impact of environmental (in the organizational sense) distractions, and the resulting coping behaviors, on maintenance performance. Prior research focused on investigating performance out of context, that is, in controlled environments. Maintenance personnel must not only achieve technical task completion, they must also contend with an environment that provides many distractions that may impede that task performance. This investigator spent one week at three different bases, one MAC, one SAC, and one TAC. He spent 107 hours observing eight different crew chiefs and nine different specialists. Because the study was designed as exploratory research the methodology precludes generalizing the results to the Air Force maintenance population. However, the methodological and conceptual problems encountered in the exploratory research are resolvable and a viable research plan to conduct a representative study is presented. The phenomenological data support the original concept and suggest that the relationship between performance and contextual variables is even more important to productivity than originally assumed. Those maintenance people observed spent fifty percent, or better, of their maintenance shift coping with environmental distractions that for the most part hindered task accomplishment. At the same time, study results suggest that there are multiple Air Force maintenance environments, rather than a monolithic maintenance environment, but the maintenance system assumes a monolithic environment.

Age Related Changes in Cognition during the Working Years.
Final rept. 1 Apr 79-31 May 81,
Earl Hunt, and Christopher Hertzog. 31 May 81, 128p
Contract N00014-79-C-0345

In order to alleviate present and anticipated personnel shortages, the Armed Services will have to move away from the present reliance on young adults as a source of personnel. The impact will be heaviest on the technologically oriented services, such as the Navy. Previous analyses have indicated that adults in the normal working years (20-60) can meet the physical requirements of most service occupations. Questions remain about the effects of age changes in cognition on work performance of older personnel. Changes in cognitive capacities over the adult working years are reviewed here. Two major decrements are noted; a general deterioration of sensory functioning and a slowing of higher cognitive processes. The latter slowing may be sufficient to affect performance in situations in which time demands on responding are on the order of fractions of seconds, but would probably not affect most work situations. The general effects of experience, combined with an increase in verbal intelligence throughout the working years, argues for increased competence of older individuals in many work situations. There are indications

that spatial reasoning abilities and the ability to develop solutions to new problems ('fluid intelligence') decrease with age. Secondary and review articles may overstate this effect. The primary studies themselves have serious design flaws.

Colorado Univ. Health Sciences Center, Denver.
A Combined Developmental/Environmental Screen.
Final rept. 1 Jan 78-31 Dec 80,
William K. Frankenburg, and Cecilia E. Coons.
Jun 81, 83p MCH/CCS-81/03
Grant PHS-MC-R-080415

The goals of this project were to develop an instrument to screen a child's early home environment, and to evaluate the efficiency of a combined developmental/environmental screening procedure in identifying children who are at risk of experiencing later school problems. The project was divided into three phases. Phase I consisted of development and refinement of the Home Screening Questionnaire (HSQ). The HSQ is a parent-answered questionnaire developed from Caldwell's Home Observation for Measurement of the Environment (HOME). Phase II consisted of screening a large number of 0 to 6 year-old children using the HSQ and the Denver Developmental Screening Test (DDST). Phase III consisted of obtaining school status information for siblings of children screened as a tentative estimate of the validity of the HSQ.

Psychological Job Stress and Coronary Heart Disease.
Final rept.,
Joseph H. Chadwick, Margaret A. Chesney, George W. Black, Ray H. Rosenman, and Gunnar G. Sevelius. Nov 79, 170p
Contract CDC-99-74-42

The relationship between psychological job stress and coronary heart disease (CHD) was studied in a population of 397 male professionals of an aerospace firm. Representatives from various occupational categories, including finance and accounting, new business projects, product assurance and a comparison group were studied. Data was collected from questionnaires including job information, work and family environment scales, coronary proneness traits, personality scales, job and life stress scores and psychological distress. Information was gathered on blood pressure, serum lipid concentrations, adrenergic items, cardiovascular disease (CVD) status and medical history. Medical and cardiovascular examinations were repeated at intervals of 2.5 months for half of the study population. The workers completed weekly workload assessments and recorded their appraisals of pressure and strain. Low level relationships between psychological variables of job stress and behavior and physiological data relating to CHD risk were found. Individual characteristics and the job environment and their interactions were involved in processes that resulted in CHD risk. Variables with a strong effect on cardiovascular disease (CVD) status did not have a strong effect on physiological variables.

Ethics and the Military Profession. Can Ethics be Taught.
Dec 78, 12p

The degree to which cadets grow morally and forge for themselves an ethic encompassing more than the words of the Honor Code depends on their total experience, much of it well outside the ken of USMA. Within its proper limits, however, West Point asks cadets to participate fully in its special moral climate. The Academy encourages the development of mature moral beliefs by offering to cadets both required and elective courses investigating moral issues, by bringing other training and experience of cadets together so that all elements are mutually supportive, and by providing a staff and faculty attuned to the need for an Army led by officers with well-reasoned moral views. To the extent that cadet and institution succeed, the graduated cadet should possess an ethic resulting from an informed understanding of the moral implications of being a particular kind of human being--a professional officer of the U.S. Army.

Ethics and the Military Profession. A Dialogue on the Law of War. Degrees of Responsibility and the Law of War. Book Reviews,
James L. Narel, Michael W. Taylor, Joel D. Miller, and Roger A. Rains. Apr 80, 20p

If ever you feel a perverse need to provoke a heated debate among military personnel, try generating a discussion about the law of war. All soldiers know that the Law of Land Warfare is a formal legal code; that adherence is not a matter of personal preference; and that violations are punishable offenses. But is the law appropriate. Is it effective. Some who would describe themselves as 'realists' maintain that combat is not an activity that lends itself to regulation and that we are being hypocritical when we profess to be guided by legal constraints. Others feel that, while the goal of limiting the suffering and destruction of war is noble, the circumstances, particularly of modern war, make application and enforcement of the laws of war impossible. What case can be made in support of such laws. Since the issue is one that lends itself naturally to debate, the dialogue format introduced in the January, 1980 edition of Ethics and the Military Profession is employed again here. The characters, Victor, Justin, and Henry-David, represent, we believe, attitudes about the law of war that are genuinely popular in the Army. Their fictitious discussion is intended to give the subject as reasonably thorough airing.

Ethics and the Military Profession. The Professional Ethic.
Aug 78, 29p

In this issue we are concerned with whether or not there is a professional ethic for the military. Implicit in such a discussion is the very essence of the occupation. Is the professional model the correct one, or, as many sociologists report, are we drifting aimlessly towards a more occupational mode. Presently the military is between two modes likely to move in either direction depending on future decisions about benefits and unionization and the military's own introspection in regard to its ethos. Consequently, at the moment the military finds itself in a somewhat molten condition.

Services to the Elderly in England: Impressions from a Sabbatical,
Eva J. Salber, and Harry T. Phillips. Dec 80, 166p
Grant PHS-PE-24016
Sponsored in part by North Carolina Univ. at Chapel Hill, and Fogarty International Center, Bethesda, MD.

The present report concerns England only and is divided into ten chapters. The first chapter is a brief overview of some demographic and other data on the elderly population in England. The second chapter gives an overall picture of the national service organization, as it applies to the elderly. The subsequent seven chapters describe services in England in the following areas: geriatrics, terminal care, community nursing, personal social services, transportation, housing, and voluntary services. The final chapter presents an overview of impressions of the state-of-the-art in England of services for the elderly and a few thoughts on how the US might benefit from the English experience.

A History of the Anglo Period. Tumacacori National Monument, Arizona.
Historic structure rept. 1691-1977,
A. Berle Clemensen. Sep 77, 121p FNP-560-81-36

The historical data section of the Historic Structure Report for Tumacacori National Monument concentrates on the post-1848 period and its stabilization-restoration history. There is some narrative concerning the Spanish Mission period in the Southwest which led to the construction of the church in 1802. The church was abandoned in 1848. It was occasionally used and visited by the early settlers after that year. The report includes excerpts from diaries and accounts which mention Tumacacori and describes its condition at that time. The report also discusses the movements to protect and preserve the vandalized structure which began in 1905.

White House Conferences as Agents of Social Change: Symposium Book of Readings.
Final rept.,
Wilma T. Donahue. 1979, 225p ICSG-79/1
Grant DHEW-AOA-90-A-1799

The volume addresses: (1) the role of White House Conferences in effecting societal change; and (2) adaptations to population aging in the United States and in less developed countries (LDC's). The first paper discusses the development and objectives of White House Conferences in relation to social action. The second contribution considers impacts of population aging on developed and less developed countries with particular reference to LDC's which have 70 percent of the aggregate world population and are striving for an equitable share of the world's resources. Implications for developed economies are suggested. The third paper suggests that traditional emphasis on pursuit of affluence and consumption will give way to concern for quality of life. The essay is followed by a treatise on 'Aging in the Future' in which scenarios for societal transformation are presented: (1) a society of abundance and (2) one of scarcity. Implications are discussed for elderly income, work and retirement, health and services, housing, and uses of time. The fifth paper discusses U.S. financial outlays for the elderly in relation to levels of economic activity. The final presentation discusses socioeconomic transformations in LDC's, with particular reference to older people.

Factors Affecting Food Stamp Participation Rates and Per Capita Benefits.
Staff rept.,
Robert A. Hoppe. May 81, 25p AGESS-810409

Several socioeconomic variables had an impact on Food Stamp Program participation and per capita benefit levels in 1976. Among the significant variables were the unemployment rate, the percentage of the population that was white, the poverty rate, participation in the Aid to Families with Dependent Children Program, cashed-out Food Stamp benefits, region of residence, and metropolitan residence. Metropolitan residence increased participation and per capita benefits. This suggests that succesful approaches to administering the program in metropolitan areas may not succeed in nonmetropolitan areas.

AOA Launches National Legal Services Effort,
Dan Fritz. Jan 76, 7p OHD-76-20115
Pub. in Aging Magazine, p1-5 Jan 76.

For the first time, a systematic national effort is taking shape to develop legal services specifically addressed to the needs of older persons. The primary thrust of this effort is 11 legal services Model Projects funded by the Administration on Aging in July, 1975. AoA's support for legal services for older persons addresses an important but long ignored need. In addition to the legal problems encountered by all citizens, the elderly face special legal problems in dealing with pensions, medical care, age discrimination, guardianship, involuntary commitment, nursing home care, and housing. They are often the main claimants for such governmental programs as Supplemental Security Income, social security, Medicare, and Medicaid. Consequently, the elderly need unique legal assistance.

Breath-Alcohol Testing: Disposable Breath Tester.
Final rept. part 1, Sept 77-Dec 80,
Kurt M. Dubowski. Dec 80, 42p DOT-HS-805-897
Contract DOT-HS-7-01795

The report includes details of attempts to develop an inexpensive, disposable device for breath-alcohol screening tests which would be legally acceptable. It was found infeasible to develop such a device based on length-of-stain alcohol indicators. Silica gel and various other reagent carriers proved inadequate as nonreactive, nonchanneling indicator substrates. Acid potassium dichromate solution and other alcohol reagents proved insufficiently sensitive or stable for the purpose, or did not yield adequately sharp and intensive color changes. An innovative system was developed for generation of alcohol vapors with high accuracy and precision.

What is the TRPA. A Bureaucratic Hassle, an Eco-Sell-Out, or a Pragmatic Problem Solver,
Paul Meyer. 1974, 27p NSF-RA-E-75-077
Grants NSF-ISP73-09293, NSF-GT-39556

The Tahoe Regional Planning Agency (TRPA) was created through a bi-state compact and an act of Congress to maintain an equilibrium between the region's natural endowment and its manmade environment. It was mandated to adopt and enforce a regional plan of resource conservation and orderly development. The Lake Tahoe Basin, one of the world's most unique and beautiful environments, attracts a great many recreation seekers. In addition, the basin has a number of gambling/entertainment facilities which also draw large numbers of people. The problem has been to balance the demand of the people to visit and enjoy the area with the need to protect the environment. This report describes the organization and budget of TRPA and the creation, periodic revision, adoption, implementation, and enforcement of plans and ordinances for the development and use of the basin. Six ordinances which are now laws involve land use, tree conservation, timber harvesting, shoreline construction, grading, and subdivisions. Controversies resulting from TRPA and the agency's future direction are addressed.

Racial Discrimination in Urban Rental Housing: An Analysis of Southern Nonmetropolitan Markets with Implications for Demand Side Housing Assistance.
Doctoral thesis,
c1976, 350p NSF/RA-761619
Grant NSF-GI-33649

This doctoral dissertation analyzes the influence of racial discrimination per se on price determination and allocation processes in the southern nonmetropolitan rental housing market. It assumes that the housing market is completely structured and deals with marketplace manifestations of the collective actions of individuals. A market perspective based on housing prices and consumption levels leads to hypotheses readily amenable to systematic testing. The author presents an equilibrium theory of housing price determination which accounts for the effects of racial prejudice and preferences for segregation. These hypotheses are then subjected to rigorous statistical testing. The thesis brings together results of the analyses to examine the influence of market discrimination on improving housing conditions through market oriented strategies, a guaranteed annual income, and a housing allowance program. The analysis considers levels of housing improvement likely to be realized by blacks and whites. The major conclusion is that the rental markets studied are a weak union of two somewhat independent, racially-defined submarkets. The potential magnitude of the discriminatory effects of an allowance program is estimated.

A Cultural Resources Inventory Survey at Chattahoochee Forest National Fish Hatchery, Fannin County, Georgia.
Survey rept.,
Lesley M. Drucker. Oct 80, 46p

Documentary research and archaeological survey were undertaken by Carolina Archaeological Services at the Chattahoochee Forest National Fish Hatchery, Fannin County, Georgia. During the protohistoric and early historic period, this region was inhabited by Cherokee peoples, whose ancestry in the region extends at least back to approximately 1000 A.D. Prior to this time, aboriginal occupation appears to have been sparse, probably concentrating on the wider and larger river valleys. No evidence of prehistoric or historic land use prior to the early 20th century was observed or indicated during project research. A 15-acre proposed oxidation/settling lagoon area at the northern end of the hatchery property is recommended for archaeological clearance.

Individual, Family and Village Literacy in Development,
Edgar G. Nesman, Thomas A. Rich, and Sarah E. Green. 31 Mar 80, 163p AID-PN-AAH-530
Contract AID/DSPE-C-0040

Literacy has long been considered an important factor in promoting individual change toward more modern behavior. An individual's own literacy has traditionally been the variable investigated--with conflicting results. It has been proposed by several authors that a clearer picture of the importance of literacy to individual behavior change in peasant societies may be gained by investigating the relationship between an individual's membership in a literate group (and the amount of literacy in the group) and his tendency to change his behavior in the direction of more modern practices. It is the purpose of the current study to explore the relationships between an individual's literacy, that of his family and village and his tendency to adopt modern farm practices.

Community Service Society of New York, NY.
Report and Recommendations of the In-Rem Housing Task Force Committee on Housing and Urban Development.
5 Mar 81, 29p

Today, the nation is in the midst of a severe crisis in rental housing. Operating costs are soaring, housing in aging, and tenants' income is not keeping pace with inflation. Owners are caught by insufficient cash flow, returns fall short of expectations, and abandonment follows. This crisis looms largest in New York City. Here, some 75 per cent of housing units are in multiple dwellings; in no other city does this figure even reach 50 per cent. As of May 1980, in rem proceedings have brought into public ownership 12,444 residential properties containing 38,910 occupied units. Rental housing--and in particular, housing for low-income and moderate-income households--holds little, if any, promise for adequate returns for the private real estate sector. Responding to the hard realities, City government has devised new ways to manage, maintain, upgrade, and dispose of housing it takes for tax arrears. This report evaluates these strategies and proposes policy directions for the future.

Archeological Test Excavations at 38Lu107, Rabon Creek Watershed, Laurens County, South Carolina.
Final rept. 1981,
W. Dean Wood, and Thomas H. Gresham. 15 Jan 81, 66p
Contract HCRS-A54130(80)
Sponsored in part by Soil Conservation Service, Columbia, SC. Prepared in cooperation with Heritage, Conservation and Recreation Service, Atlanta, GA. Interagency Archeological Services.

Test excavations at 38Lu107, a prehistoric, multicomponent site on South Rabon Creek in Laurens County, South Carolina, are summarized. The site is small, about 1920 square meters, and contains disturbed archeological remains to a depth of 30 cm below surface. Artifacts were recovered from Early and Middle Archaic periods as well as the Middle Woodland and Mississipian periods. The major occupation appears to have taken place during the Middle Archaic and Middle Woodland periods primarily. Features were found to be preserved below the plow zone in several areas of the site. The analysis of chipped stone tools and lithic debitage reveals that quartz predominates as the preferred raw material with various kinds of cherts and rhyolites also present.

Alternative Interventions for Sexual Assault Victims,
Karil S. Klingbeil, and Doris A. Stevens. 30 Jun 79, 16p

The researchers are developing and evaluating a systematic agency-initiated rape crisis intervention program, with particular emphasis on ameliorating coping difficulties frequently experienced by rape victims. About 100 female rape victims in a hospital emergency room are being assigned to control and experimental groups. Agency personnel contact the experimental subjects at regular intervals. All subjects are given tests and being compared on coping difficulties at 1, 6, and 12 months after the rape. This project aims at providing more effective intervention strategies in rape centers throughout the country.

A Report on the Mitigation of Impacts Upon the Beckwith Mound Group (47RI20) Gotham, Richland County, Wisconsin.
Alan R. Woolworth, and Nancy L. Woolworth.
Aug 80, 104p

This report summarizes past and present day archeological investigations conducted on the abandoned townsite of Richland City, Wisconsin (ca. 1849-1920). This village was platted on top of several prehistoric mound, village and workshop sites at the mouth of the Pine River, Richland County, southwestern Wisconsin. A historical background of the region and a chronology of the regional cultural sequence is furnished. Before destruction by farming and townsite activities, five mound groups containing at least 64 mounds, including 2 effigy mounds, stood at this location. Associated with them were several habitation areas and stone knapping sites. Erosion of the north bank of the Wisconsin River from 1872 onwards destroyed much of the townsite and the prehistoric sites on which it stood. All available evidence points to the conclusion that little of the mound group or other features have survived.

Lyndon B. Johnson Birthplace-Cottage: Lyndon B. Johnson National Historic Site, Stonewall, Gillespie County, Texas.
Furnishing study 1889-1979,
Edwin C. Bearss. May 79, 191p FNP-560-81-47

The Furnishing Study of the Lyndon B. Johnson Birthplace Cottage is a two-part documented study of the relevant furnishings and houses. The first part focuses on the house built by Big Sam Johnson in 1889 and where Lyndon Baines Johnson was born on August 27, 1908, and in which he lived until September 1913. The second part of the study concentrates on the Cottage that President and Mrs. Johnson erected and furnished as a 'guest house' in 1964. The purpose of the reconstructed Birthplace is to interpret the years during which the future president, his parents, and paternal grandparents lived on this site and ranched and farmed in Stonewall.

Working Manual of Evaluation Techniques for Primary Prevention Programs.
David B. Langmeyer. 1978, 125p
Executive Summary available from PROJECT SHARE, P.O. Box 2309, Rockville, Md. 20852 as SHR-0003862/ES.

The emphasis of this manual is on information - based (empirical) evaluations. Five divisions of the manual discuss assessing needs, formulating goals and objectives, defining evaluation methods, conducting the evaluation, and utilizing the results. Needs assessment strategies include primary methods, such as collecting original information from community source meetings or surveying community views. Secondary methods of needs assessment use information that has already been collected; such information comes from descriptive statistical data available from public records and public reports. The need for goals that direct program staff toward specific activities and measurements is emphasized. Most useful evaluation methods are listed. Considerations which affect the choice of measurement strategies include multiple methods for measurement, characteristics of the client population, and the need to make procedures routine. Ethical principles which must be observed in obtaining information include ensuring prior knowledge and informed consent of subjects, providing subjects with honest descriptions of the study, informing subjects in advance of all aspects of the research that bear directly on them, and keeping the subjects' data in confidence. Reliability and validity of test instruments are discussed, and evaluation designs are defined and described. Approximately 275 references are appended.

Pennsylvania Dept. of Public Welfare, Harrisburg. Office of Children and Youth.
Making the Almost Impossible Possible: Evaluation of Human Services.
Richard Fiene, and Earl Douglas. 1979, 20p

This article describes a model developed by the Pennsylvania Department of Public Welfare, Office of Children and Youth, Bureau of Child Development Programs, for the evaluation of its child day care programs which includes the fiscal, statistical, and programmatic components of day care programs. A manual system in 1979, it could become computerized. The Child Development Program Evaluation (CDPE) Project sought to improve the quality of care for chidren in day care in Pennsylvania by addressing 16 key components of child day care. The implementation of the CDPE has resulted in increasing day care services' compliance with regulatory standards and the upgrading of services. The model, called Ecopad (Ecological Paradigm for the Delivery and Assessment of Child Care) was designed to provide the accountability needed in the bureau of child development programs. The model integrates data across three component areas: program (services), statistical (reporting), and fiscal. Thus, Ecopad constitutes the technology built to manage the data being collected on child care programs. Schematic figures illustrate each of these three components and their interactions with each other. The report concludes that the CDPE project has shown how to develop criteria for the standardized assessment of the programmatic components of social service programs. Coordinating the fiscal and statistical components with the programmatic component permits relative objective evaluation of the total impact and cost of a social service program. Ecopad provides the model for the integration of the programmatic, fiscal, and reporting components in both a naturalistic and administratively sound manner. Footnotes and three references are provided. (Author abstract modified).

Title XX. Comparing the Costs of Alternative Delivery Systems.
Jun 79, 81p
Contract DHEW-APS-105-77-7200
Executive Summary available from PROJECT SHARE, P.O. Box 2309, Rockville, Md. 20852 as SHR-0003910/ES.

An analysis of the costs of direct versus purchased provision of homemaker / chore services in Utah is presented in terms of factors that affect the unit costs in urban and rural settings. Conducted by the Department of Health, Education, and Welfare under a contract with the Administration for Public Services, this study examines such alternative modes of service delivery as direct delivery by the government agency, public purchase delivery through another agency, and private purchase delivery through private for - profit or nonprofit organizations. To calculate and compare costs of service delivery per hour for all these alternative delivery systems in urban versus rural settings, the researchers included administrative costs, as well as the hourly wages of the homemaker staff. Based purely on homemakers' hourly wages, private service providers would appear to be cheaper, because they pay their homemakers lower wages, but when administrative and overhead expenses are taken into account, direct delivery by government agencies (despite higher salaries paid to their homemakers) appears to be more cost - effective. The necessity for further research, due to the limited number of observations on which this study is based, is emphasized. Eight tables and four graphs are included. A total of 50 references are provided.

Access by Adult Adoptees to Information and/or Reunion With Birth Parents: Towards a Public Policy Position.
Marcus Gigliotti. Jun 79, 34p

Following an examination of issues and policies regarding adult adoptees' access to information about birth parents, this report proposes a system for New York State, in which the rights of adoptees, the rights of the adoptive parents, and the rights of the birth parents would all be respected. Increasing numbers of adult adoptees are seeking more information about their genetic histories and about their birth parents. Adoptees' groups have been formed and actively encourage and assist such information searches. Under current law, original records are sealed following an adoption, and a new birth certificate is issued. While the access issue focuses on the adoptee, the other members of the adoption triangle have concerns, needs, and rights. Adoption agency problems, psychological dimensions, legal dimensions, and medical dimensions also need to be considered. Several States and Canada have some form of open access policy. Legislation in New York State should be based on the principle of respect for all parties' rights. A mediating structure is needed to balance adoptees' rights and needs with those of birth parents and adoptive parents. It is proposed that a unit be established within the State Department of Social Services to provide a statewide consulting service on adoption records. The unit would assist adult adoptees in obtaining access to their adoption records and would aid them with reunions, while balancing the rights of all involved. If adoptive parents or birth parents objected to release of information, an informal mediating process would be used to determine whether identifying information should be released. Footnotes and a description of several individual States' policies are included.

Care Network for Individuals With Disabilities, Volume II: A Description of Alternative Residential Care Models and Facilities.
May 79, 57p
Background Document for the Public Health Council.

This document attempts to provide an overview of New York State's various residential care models for individuals with disabilities, as well as of the facilities, programs, and services they incorporate. Within New York State, the human services network for individuals with disabilities includes many models of residential care. While some of these care models have a long history, others have evolved recently in response to the State's initiatives to decrease the population of disabled persons in State institutions and to preclude any further inappropriate institutionalization of individuals with disabilities. With this augmentation of care models, the complexity of the State's human service network for individuals with disabilities has significantly increased. The focus of this document is on those disabilities which so severely impair the individuals' ability to function that supervised residential care in a health, mental hygiene, or domiciliary facility is required. This category does not include the vast majority of persons with permanent disabilities who do not require such care and

reside independently, using outpatient or other community services. Following a description of the major care models and their residential alternatives, the report discusses the plans and initiatives of the Office of Mental Retardation and Developmental Disabilities and the Office of Mental Health in evolving care models and specific residential care modalities. A final section summarizes the major findings pertaining to the State's residential care network for the disabled populations considered and State policy germane to it. Tabular and grahic data and footnotes are supplied.

New York State Board of Social Welfare, Albany.
Appropriateness of Health Care Facilities for Individuals With Disabilities. A Report to the Public Health Council.
May 79, 76p
Executive Summary available from PROJECT SHARE, P.O. Box 2309, Rockville, Md. 20852 as SHR-0003994/ES.

This report contains the results of a policy study made by the New York Board of Social Welfare; the board examined the appropriateness of segregated health care facilities for individuals with disabilities. The objectives of the board's study were to outline the critical issues pertaining to the appropriateness of such facilities, research these issues, and draw conclusions regarding them. Two major issues were identified: (1) what residential care alternatives are available for individuals with disabilities within the State's human service network; and (2) what State policy positions have shaped the State's residential alternatives for the disabled and will continue to affect their future nature. The staff relied on four main sources for the study: the literature, an interagency working group of representatives of concerned State agencies, voluntary agencies and service providers, and individuals with disabilities and their families. The role of health care facilities in the long - term residential care for the disabled was found to be diminishing; furthermore, such facilities are appropriate only for a small proportion of the disabled population. On the whole, conclusions indicate that the State and voluntary associations concerned with individuals with disabilities, and the disabled themselves, view the essential criteria for residential care to be its capacity to enable the individual to reside in an environmental setting which is the most normal and as satisfying as possible. Appendices provide related materials. Tables, footnotes, and 30 references are given.

New Jersey State Dept. of Labor and Industry, Trenton. Div. of Vocational Rehabilitation Services.
Expansion of Services for Deaf and Hard of Hearing Clients.
Final rept.
Patricia A. Tomlinson. 1979, 42p
Innovation and Expansion Grant.

This project was conducted from January 1976 through December 1978 to increase use of and accessibility to the full range of vocational rehabilitation services by and for the deaf and hard - of - hearing population in New Jersey. Objectives were to increase the number of deaf persons served by the New Jersey Division of Vocational Rehabilitation Services (NJDVRS), to improve the quality and quantity of NJDVRS programs for deaf and hard - of - hearing programs by employing staff specialized in hearing impairment and associated communication modes, and to increase the availability of ancillary services for deaf and hard - of - hearing persons through specialized staff efforts. Staff responsibilities in the project were defined, and relevant training was provided. Four major accomplishments were realized: (1) increase in New Jersey professionals and service providers skilled in working with deaf and hard - of - hearing rehabilitation clients; (2) increase in skills and expertise of NJDVRS staff; (3) increase in the quality of services provided (evaluation, hearing aids, training, communication skills, job readiness counseling and job development, group sessions, coordination, counseling, service lists, new forms and policies, and cooperative working arrangements with the New Jersey Division of the Deaf); and (4) increase in the quantity of services provided (cases served and cases rehabilitated). Problems encountered in the course of the project pertained to New Jersey civil service regulations, the coordination of services in highly populated areas, hearing - impaired staff, hearing aid pricing, the availability and payment of interpreters, electronic data processing and coding, the naivety of service providers, and deaf consumer education regarding the vocational rehabilitation role. Plans for the continuation of project activities are discussed. Supplementary data and statistics on project results are appended.

Special Report on Dental Care for Handicapped People.
John D. Suomi, Merle G. McPherson, Scott McGuire, Richard Melia, and Alan Sandler. Dec 79, 65p
Executive Summary available from PROJECT SHARE, P.O. Box 2309, Rockville, Md. 20852 as SHR-0004093/ES.

The dental treatment needs of the handicapped versus the dental services they receive are discussed in terms of congressionally mandated programs to expand and improve such services, and the special problems and barriers to dental care impairing the effectiveness of dental care delivery to this group. The handicapped population of the United States, numbering approximately 33 million, is known to have proportionately greater dental treatment needs and to receive less dental services than the nonhandicapped population. The cost of dental services, transportation difficulties, poor design of buildings and dental offices, and difficulties in identifying and securing a source of dental care are cited among the problems faced by the handicapped in this area. Congress has authorized several programs whereby the handicapped can receive dental services. Although data on the impact of these programs on the dental health status of the handicapped are not routinely collected, areas of weakness have been identified; these include coordination of activities relating to the oral health of the handicapped, training of dental students in the care of the handicapped, access to dental offices, special dental facilities, and access of needy handicapped adults to dental care under Medicaid. Financial remuneration of providers of dental services to the handicapped is also emphasized. Dissemination of information on available dental services to the handicapped and their families, and research and development programs in the field of dental care for the handicapped are discussed. Specific programs include the creation of a centralized system to monitor and evaluate progress being made in improving the access of handicapped persons to dental care. A bibliography listing 19 references is appended.

Arkansas Dept. of Human Services, Little Rock. Policy Analysis Section.
Emotionally Disturbed Youth: Implementation Work Plan.
Nov 79, 44p

This 1979 report outlines 20 tasks towards developing a treatment system for emotionally disturbed youth in Arkansas. The system provides five levels of care and allows free movement of clients from one level to another. The tasks are sequential. First, project staff must find out if existing residential treatment programs and centers can be used to care for emotionally disturbed youth, and to what extent. Concurrently, a client / management information system should be developed to provide data on all services for youth in Arkansas. Next, consistent standards should be set up for residential treatment, diagnosis, and other youth services. These standards will also document established agreements among various agencies working with children for better - coordinated services. The following step is establishing a case assessment committee and a means of reviewing youths' cases. Policies for youth advocacy and a study of current juvenile and mental commitment statutes must also be undertaken, as well as coordination of foster care and identification of all youth services and resources in the State for the information of youth mental health workers. Next, programs for moderately or acutely disturbed youth should be implemented, residential treatment for them expanded, and placement and referral begun. Final tasks will include obtaining legislative authority for service contracts with residential treatment centers, developing program monitoring techniques, and others. Task instructions and timetables are provided.

Arkansas Dept. of Human Services, Little Rock. Policy Analysis Section.
Evaluation Procedures Guide.
Jan 80, 43p

This collection of technical assistance handouts explains a program evaluation flow chart used in evaluating Arkansas Department of Human Services programs. The flow chart is presented and explained, and explanations of each evaluation phase and their activities follow. No evaluation study should be attempted until the program has been described with information included on legal references, program purpose, clients, staff, administration, program procedures, resources, and costs. At this point, goals and objectives for the program and the evaluation itself must be specified, along with questions outlining the measures to be used. The purposes of the study must be considered, as well as what groups will be receiving the evaluation results. Based on each question, the evaluator must determine what information is required to answer the question, where that information can be located, and how it can be retrieved. The methodology phase involves acquiring or developing any instruments necessary to gather the specified data, selection of an appropriate evaluation design and sampling plan, and development of data analysis and collection procedures with accompanying time - lines and resources required. To manage the evaluation study itself, the evaluator should specify task assignments and monitoring procedures. A methodology document outlining all planning information developed thus far is created and presented to relevant audiences. Finally, after the sample is drawn, and data are collected and analyzed, the final report is written. Charts and approximately 10 references are included.

Training and Employment Services Policy Analysis: A Look at Community Based Services for Handicapped Individuals.
First year progress rept.
Claude W. Whitehead, John DeWilde, and John H. Noble. 1 Sep 79, 203p
Executive Summary available from PROJECT SHARE, P.O. Box 2309, Rockville, Md. 20852 as SHR-0004406/ES.

This paper reports on an initiative to address the policies of training and employment services which affect the delivery of services to handicapped individuals in community - based sheltered workshops. The demand for special services is in contrast to the recent public policy of mainstreaming. The primary training and employment service facilities for severely handicapped persons in most communities are work activities centers, developmental centers, and other sheltered workshops. DHEW responded to studies and conferences on these workshops by initiating Training and Employment Services Policy Analysis (TESPA) to focus on the training and employment services. TESPA established a task force to identify the major issues, policy problems, and tentative action proposals. Also, TESPA will interview key personnel in six preselected States. The interviews will address the dual status of handicapped individuals in community - based sheltered workshops, financing of training and employment services, wage earnings and other income of handicapped individuals in workshops, work supply and technology, and the right of handicapped individuals to live and work independently. The working paper for the field testing and validation activity has refined major issues, policy problems, and action considerations in all of the above areas. Tables and references are included. Two appendices present a summary of the major findings and recommendations of related research and other studies, and the proceedings of the DHEW / TESPA Task Force on Current Issues and Policy Problems.

SHR-0005619 PC **A04**/MF **A01**

Families for Black Children: The Search for Adoptive Parents. Number 2: Programs and Projects.
Annie Lee Sandusky, Jane Harwood Rea, Ursula Gallagher, and Elizabeth Herzog. 1972, 73p
DHEW/OCD-72/35
See also related document, SHR-0005618.

Summary descriptions are given of 20 ongoing programs to increase the number of adoptive homes available for black children. Each summary covers the program's community involvement, active involvement of the public welfare department, interagency coordination and collaboration, and public information campaigns. The programs described are in Los Angeles, Calif., Chicago, Ill., Baltimore, Md., Massachusetts, Michigan, Minnesota, New York City, North Carolina, Ohio, Oregon, and Washington State. Each description lists the program's sponsors, names of the coordinating agencies, the staff involved, a summary of the program's activities, a discussion of problems and obstacles encountered, and an evaluation of the activities which the program has found most helpful. Where available, funding information is given. The introduction, which is basically a summary chapter, notes that, regardless of other differences in approach, each program has concentrated on involving the community in the search for adoptive homes for black children. The involvement has taken many forms: meetings with black community leaders, media campaigns, meetings with both black and nonblack community organizations, and intensive educational campaigns. The major problems facing most programs are shortages of funds and staff. Several agencies report that their major problem is the long - term placement of black children in foster care as a substitute for the release of these children for adoption. A few footnotes are included.

Children's Bureau, Washington, DC.
Houston Parent-Child Development Center.
Final rept.
Dale L. Johnson, Alfred J. Kahn, and Hazel Leler. Aug 76, 195p
Grant DHEW-90-C-379
Executive Summary available from PROJECT SHARE, P.O. Box 2309, Rockville, Md. 20852 as SHR-0005895/ES.

This report describes the development and evaluation of a parent education program, the Houston Parent - Child Development Center (PCDC). The program was planned in 1969, and the first groups of families entered in 1970. In all, 185 families were in program groups, with 82 families finishing the program; 188 families were in the control group, with 101 finishing. The instigation for the program was a concern for the educational future of the young child of a low-income, minority background. The PCDC project was begun on the assumption that school experience could be more productive if the child's parents could be enlisted as effective preschool teachers of the child. Families were selected through door - to - door recruitment and randomly assigned to program or control groups. Mexican - Americans were chosen as having the lowest income level, fewer years of education, and the most children under 5 in the area. Evaluation results show that parents indicated satisfaction and children were happy while participating; significant group differences favoring the program group children were obtained on both the Bayley Mental Development Index and the Stanford - Binet. The report concludes that the program has attained the immediate goals desired for participating families but that a full evaluation of its effectiveness awaits followup study of the children in school. The report discusses at length the background, development, and structure of this study, and the various testing procedures on which its results are based. There are 14 tables, 13 figures and a bibliography.

Society for the Study of Social Problems, Buffalo, NY.
Social Learning Theory and Sex Roles: Violence Begins in the Home.
Mildred Daley Pagelow. 1978, 60p
Annual meeting of the Society for the Study of Social Problems, September 1978, San Francisco (CA).

The kinds of evidence produced to support and generate the recent rush of publicity about the battered husband 'syndrome' are examined, followed by a brief overview of some current research on family violence and a discussion of the relationship of sex roles to male - female violence. An analysis of the studies purporting to show husband battering to be a serious social problem reveals no sound empirical evidence supporting such a contention. The most publicized study dealing with this subject, that by Suzanne Steinmetz, is flawed by the use of biased data, misinterpreted data, baseless conjecture, and the biased selection of other scholars' works. The evidence overwhelmingly indicates that woman battering is the most serious social problem issuing from prevalent male - female violence. Basing their ideas on impressive studies, social learning theorists maintain that patterns of male aggressiveness and violence and female victimization are learned by children from role models within the family. Further research is needed to determine the nature of influences that stimulate violence in male - female relationships so that effective means can be devised for the prevention, control, and elimination of physical battering in intimate relationships. Further, more and better research should be conducted into the transmission and learning of cultural norms regarding violence. Also, public education should attempt to revise sex role concepts so that males may be encouraged to view gentleness, nurturance, and empathy as behavioral ideals, while females are taught to view themselves as social equals with males rather than as passive - dependent subordinates. Tabular data, footnotes, and over 90 references are provided.

Domestic Abuse Act (Order for Protection): The 'How To' Packet.
JoAnn C. Nelson, Aviva Breen, and Bev Balos. Jan 80, 53p

In 1979, the Domestic Abuse Act of Minnesota, Chapter 214, was passed. While the act covers all victims of domestic abuse, this explanation of the act is written for shelter and advocacy persons working specifically with battered women. The law provides a civil remedy for victims of domestic abuse. This remedy is a simple process designed to obtain court - ordered reliefs from the abuser. Persons covered under the law include married couples, people who live together, and family members. Ex - spouses, former boyfriends or girlfriends, and current boyfriends or girlfriends who are not living together are not covered. The law also states that the court can issue an 'Order for Protection.' Several kinds of relief can be obtained, such as a restraining order, an award of temporary custody of children, a method of temporary support for minor children and / or spouse, and an order directing the sheriff to enforce court orders at the woman's request. The court process is explained, and major features of the law are emphasized. The document contains a copy of the actual law, pertinent definitions, and five attachments giving explanations of how to fill out various legal forms; copies of the forms are provided.

Annotated Bibliography on Spouse Abuse.
Jan 80, 17p
Grants LEAA-79-TA-AX-0024, OHDS-90-CW-2189

This bibliography of 17 annotations provides a general introduction to the topic of spouse abuse. It encompasses the varied themes of victimology and victimization; the effect of the medical, legal, and criminal justice responses to women who are raped and battered; the application of the theory of 'learned helplessness' to victims of wife beating; the thesis that the causes of wife beating are built into the American social structure and its condoning of violence; and advocacy programs for abused women. The varied publications include a compilation of first - hand accounts by persons who have been brutally victimized including battered or murdered women, an article that reports a study of 20 wife assault cases, and a comprehensive book that offers specific suggestions to the battered women, to those who work with abuse victims, and to parents who wish to train children to communicate in nonviolent ways. The publications are listed alphabetically by author and were published between 1972 to 1979. Price and ordering information is included.

Films and Videotapes on Spouse Abuse.
Feb 80, 13p
Grants LEAA-79-TA-AX-0024, OHDS-90-CW-2189

Twenty films and videotapes on spouse abuse are described in this handbook. The materials examine such topics as social approval of men's physical domination over women through the early common - law practice that permitted a husband to beat his wife, provided he used a switch no thicker than his thumb; the growing public and professional support and encouragement of family crisis police intervention programs; the lack of judicial protection for victims of family violence; the scope of the problem of battered wives and the kinds of women who become battered wives; and the reasons why women remain in violent homes. In addition, the films and videotapes explore the relationship of alcohol to wife battering, the cyclical nature of abuse, the treatment of domestic violence cases by the criminal justice system, and the need for further crisis centers and shelters for battered women. Each film or videotape is listed alphabetically by producer. The dates of production range from 1974 to 1980, and information is given on purchase and rental, length of showing time, and ordering.

SHR-0040303 PC **A02**/MF **A01**
National Clearinghouse on Domestic Violence, Rockville, MD.
Problem Statement: Battered Women. A National Concern.
Apr 80, 9p

Wife abuse is a major social problem. A recent national survey revealed that at least 2 million women are beaten each year by their husbands. In addition, a 1979 Louis Harris survey in Kentucky showed that 10 percent of the wives interviewed reported physical abuse during the prior 12 - month period, and 21 percent reported some violence during their marriage. Domestic violence can result in severe injury to the victim and even death. It can also endanger persons outside the family, particularly the police, and can victimize children who are either physically abused or witnesses to the abuse of their mothers. Family violence occurs in families of every economic, racial, religious, and educational group. Pregnant women are often targets of abuse. Women may choose to remain in abusive relationships for varied reasons: psychological, moral, and economic. They are often ill - prepared to support themselves; in addition, they often hope that their husbands may change. The first step in addressing the problem of wife abuse consists of recognizing that the problem exists and condemning it as wrong. Social supports, sanctions, and resources, such as shelters for battered women, are also necessary to ensure that violence by one person against another is not acceptable, either at home or in the street. Four references are provided.

Funding Family Violence Programs: State, Local, and Private Sources of Funds.
Jul 80, 48p
Grants LEAA-79-TA-AX-0024, OHDS-90-CW-2189

This report discusses three major sources of funds for family violence programs: State and local governments and private sources. State and local government funds are of two types: (1) money allocated to the States by the Federal Government, and (2) funds generated at the State and local level. The report describes six programs through which formula grants, or funds transferred to State and local governments, are administered. These include the Community Service Administration, a

community action agency whose citizens determine where funding will be allocated, and the Comprehensive Employment and Training Act of 1973 (CETA) of the Department of Labor which contains a provision for women and displaced homemakers and whose funds could be applied to battered women's shelters and other women's crisis centers. Other programs are general revenue sharing, Title XX (DHEW), Community Development Block Grants (Department of Housing and Urban Development), and the Law Enforcement Assistance Administration (Department of Justice). The report also discusses two major ways in which State operating budgets could be tapped by domestic violence programs for support funding: expanding the funding of existing State agencies or obtaining State funding through legislative appropriations. Suggestions are given for obtaining funding from both local governments and private sources, including foundations, nonprofit and community organizations, corporations, and individuals. Fundraising resources are also listed. Five appendices contain a list of State governor's offices, CETA contacts, Title XX State agency directors, addresses of State planning agencies, and State legislation on domestic violence.

Federally Funded Projects on Domestic Violence.
Sep 80, 19p
Grants LEAA-79-TA-AX-0024, OHDS-90-CW-2189

This paper lists Federally funded projects representing national and statewide research and demonstration efforts in the area of domestic violence. Brief descriptions of the projects, addresses, and, in some cases, names of contact persons and telephone numbers are given. Programs under the Department of Health and Human Services (HHS) include public information, technical assistance and training, and research and demonstration activities related to spouse abuse that are offered by the Office on Domestic Violence. Programs for increased delivery of services to victims of domestic violence and their families provided by the Regional Technical Assistance Centers on Family Violence are included, as are three demonstration projects that provide services to children of battered spouses and seven research projects and studies under the National Institute of Mental Health. The report also describes 20 programs sponsored by the Law Enforcement Assistance Administration (LEAA) of the Department of Justice that offer communitywide solutions to family violence. In addition, five LEAA family violence programs directed at low - income domestic violence victims and supported jointly with the Community Services Administration and four ACTION demonstration projects that emphasize the use of volunteers and prevention as an approach to family violence are listed.

Funding Family Violence Programs: Sources and Potential Sources for Federal Monies.
Susan Cohen. Nov 79, 23p
Grants LEAA-79-TA-AX-0024, OHDS-90-CW-2189

This handbook lists sources of Federal funding for shelters or other support services to victims of domestic violence. Only two Federal agencies have offices dealing with domestic violence: DHEW's Office on Domestic Violence (ODV) and the Law Enforcement Assistance Administration's Family Violence Program (Department of Justice). Thirteen programs are listed under DHEW as sources for Federal monies. They include Title XX of the Social Security Act, which provides funding to the States for day care and counseling to public assistance recipients and for the prevention of child and adult abuse and neglect; Public Assistance Training Grants, which provide training in social services delivery; and the Work Incentive Program, which enables recipients of Aid to Families with Dependent Children to become economically self - sufficient. Other Federal sources of funding are listed under the Departments of Justice, Housing and Urban Development, Labor, Commerce, Treasury, Transportation, and Agriculture. In addition, programs are listed under ACTION, the Legal Services Corporation, the Appalachian Regional Commission, and the Community Services Administration.

Legal Help for Battered Women.
Lisa G. Lerman. Feb 80, 17p
Grants LEAA-79-TA-AX-0024, OHDS-90-CW-2189

This description of legal remedies for battered women outlines the most effective of the recent developments in the laws affecting battered women and describes some problems encountered in implementing the new laws. It lists some important differences between civil and criminal remedies and explains the following forms of civil relief that are available to battered women: protection order, temporary restraining order, peace bond, divorce or separation, child custody and visitation rights, alimony and child support, and money damages for personal injury. The kinds of abuse that can prompt these civil actions are described, as are their effectiveness, frequency of use, usual outcomes, and, for protection orders, processes for initiating and enforcing them. The handbook also lists abuses that may be prosecuted under criminal law. Criminal actions can be prosecuted if the police maie an arrest after being called for assistance, or the victim goes to the prosecutor's office or to an intake unit in criminal or family court and files a private criminal complaint. If evidence is insufficient to prosecute a case, the prosecutor can take one of several informal actions described here: warning letter, office hearing, information and referral, and meeting with the abuser. The varied ways that courts may use to dispose of charges besides trials are discussed, and it is suggested that battered women may also need other kinds of assistance including medical, counseling, and welfare or unemployment aid.

PROJECT SHARE (HHS), Rockville, MD.
Section 504 Resources Manual. A Guide for Small Institutions to Useful Sources, Services, and Procedures for Locating and Applying for Funds to Meet Section 504 Mandates.
Lawrence W. Marrs. Apr 81, 50p DHEW/PUB/OS-76/130
No. 19 in the Human Services Monograph Series. Prepared as a contribution to the 'Human Services Monograph Series,' Project SHARE, Department of Health and Human Services, Washington, DC.

Section 504 of the Rehabilitation Act of 1973 requires that programs receiving Federal funds allow 'otherwise qualified handicapped individual(s)' to participate in all activities. The regulation caused anxiety among administrators of human services agencies, chiefly because of the misconception that Section 504 was a barrier removal bill. This monograph dispels the misconception, provides a true picture of the bill's intent, and makes suggestions on practical, inexpensive ways of meeting the Federal requirements. However, the primary purpose of the monograph is to review the sources and services designed to aid in identifying, locating, and successfully applying for grants to comply with the Section 504 regulation. The author reviews 37 such sources and services and answers four major questions: (1) does the source or service identify appropriate sources of aid; (2) is there sufficient information about funding sources to enable one to make decisions about further investigation; (3) does the source or service supply information about eligibility, application process, etc., and does it list a contact person or agency; and (4) does it provide application guidelines and / or procedures. The strategy for responding to these major questions considers several variables, and each source or service is discussed according to a specified format. Also listed are the five levels at which financial resources may be found and tips on locating external funding. In the appendix, the author identifies other potential resources for assistance and publications on public and private sector funding and of general interest to those raising funds. Two figures are included.

Fluorometric Method for Determination of Uric Acid in Flour.
Technical rept.,
L. G. Holmes, and L. W. Smith, Jr. Jul 80, 12p
Rept no. NATICK/TR-81/003

A fluorescence technique is described for the determination of uric acid content in flour and its use as an index of insect infestation. Uric acid, a major component of the excreta of adult Tribolium used in this study for natural infestation, accumulates in infested products providing a quantitative measure of past plus present degree of infestation. The efficiency of uric acid extraction from flour with 0.2 M sodium acetate, checked by adding known amounts of uric acid to flour, is shown to be about 96-98% accurate. The method is capable of detection of uric acid at the level of 3.0 mg per 100 g of flour. (Author)

The Synthesis and Study of New Ribavirin Derivatives and Related Nucleoside Azole Carboxamides as Agents Active against RNA Viruses.
Annual progress rept. 1 Apr 79-31 Mar 80,
Ganapathi R. Revankar, and Roland K. Robins. Jun 80, 41p
Contract DAMD17-79-C-9046
Distribution limitation now removed.

To examine the structural parameters necessary for antiviral efficacy of certain azole carboxamide nucleosides and nucleotides, several imidazole, pyrazole and 1,2,4-triazole carboxamide nucleosides have been synthesized. New methods have been developed to prepare Ribavirin derivatives. All the compounds prepared during the subject contract have been tested at the U.S. Army Medical Research Institute of Infectious Diseases, Fort Detrick. Ribavirin 3',5'-cyclic phosphate (BJ-58536) exhibited superior in vivo activity against Venezuelan equine encephalitis (VEE) over that of ribavirin. In preliminary results on day 20 at 25 mg/kg/day of BJ-58536 there were 20 out of 20 survi-

vors in the VEE-infected mice compared to 8 out of 20 survivors in the control. (Author)

Structural Effects on the Circular Dichroism of Ethidium-Nucleic Acid Complexes.
K. S. Dahl. Apr 81, 252p LBL-12655
Contract W-7405-ENG-48
Thesis.
Microfiche only after original copies are exhausted.

Binding of the frameshift mutagen ethidium biomide to dinucleoside phosphates (dimers) of different base sequences was studied by optical methods, notably uv-visible spectroscopy, circular dichroism (CD), and fluorescence detected circular dichroism (FDCD). The ethidium ion intercalated between the base pairs of the minihelix formed by the complementary dimers; the stoichiometry of the complex was 2:1 dimer:dye. Equilibrium constants for complex formation showed a general preference for dye binding to complementary sequences in the order: Py(3'-5')Pu > Pu(3'-5')Pu identical to Py(3'-5')Py > Pu(3'-5')Py where Py = a pyrimidine base and Pu = a purine base. Complexes with ribodinucleoside phosphates had larger formation constants than their deoxyribo-analogues. A study of ethidium ion binding to dCA sub 5 G + dCT sub 5 G tested for any site preference of dye binding and for any correspondence between the dimer:dye FDCD spectra and oligomer:dye FDCD spectra. Ethidium ion binding and optical activity in complexes with calf thymus DNA were studied as a function of NaCl concentration. The binding constant was dependent upon salt concentration, increasing as the ionic strength decreased. The magnitude of the induced Cd band at 307 nm also increased as the ionic strength decreased. X-Ray-Absorption-Spectroscopy Study of Manganese-Containing Compounds and Photosynthetic Spinach Chloroplasts.
J. A. Kirby. May 81, 235p LBL-12705
Contract W-7405-ENG-48
Thesis.
Microfiche only after original copies are exhausted.

The manganese sites in chloroplasts, long thought to be involved in photosynthetic oxygen evolution have been examined and partially characterized by x-ray Absorption Spectroscopy (XAS) using synchrotron radiation. The local environment about the manganese atoms is estimated from an analysis of the extended X-ray Absorption Fine Structure (EXAFS). Comparisons with and simulations of the manganese EXAFS for several reference compounds leads to a model in which the chloroplast manganese atoms are contained in a binuclear complex similar to di-u-oxo-tetrakis-(2,2'-bipyridine) dimanganese. It is suggested that the partner metal is another manganese. The bridging ligands are most probably oxygen. The remaining manganese ligands are carbon, oxygen, or nitrogen. A roughly linear correlation between the X-ray K edge onset energy and the coordination charge of a large number of manganese coordination complexes and compounds has been developed. Entry of the chloroplast manganese edge energy onto this correlation diagram establishes that the active pool of manganese is in an oxidation state greater than +2. (ERA citation 06:024253)

Effect of Mg2+ on Reconstitution of H+-ATPase of Pig Heart Mitochondria into Liposomes.
Fuyu Yang, Beiqi Guo, Huang Yuguo, and Yanwu Che. 22 Oct 79, 3p
Included in Kexue Tongbao, v25 n9 p779-781 Sep 80.

In recent years the reconstitution of vesicles capable of ATP-driven energy transformation has been carried out in many laboratories, but the results are not always easily reprducible. It seems to e very important to study the optimal conditions upon which is available the incorporation of the isolated ATPase complex into artificial membranes (liposomes) in order to elucidate the structure and function of this enzyme complex. Three methods of incorporation of pig heart mitochondrial H+-ATPase into liposomes, e.e., cholate dialysis, cholate dilution and sonication, were compared in the previous work. In this paper, the effect of Mg2+ on reconstitution of pig heart mitochondrial H+-ATPase into liposomes by cholae dialysis method is reported.

Pressure Sensing with Fiber Optics and Interferometry.
Master's thesis,
Eddie J. Preston. Dec 80, 84p Rept no. AFIT/GE/EE/81M-7

A new pressure sensing device has been analyzed, built, and tested. The device uses a Michelson interferometer to monitor pressure-induced fluctuations of a polished silicon diaphragm. Probe flexibility is achieved by mounting the diaphragm on the end of a single mode optical fiber; the coupling apparatus used permits interference to occur with the fiber in one leg of the interferometer. The phase of the resulting pattern is locked using a piezoelectric length transducer and phaselock loop control techniques. Formulas developed to model the system input/output characteristics led to the construction of a working prototype. Long term drift for the system was negligible. Short term drift limited the resolution of the system to 7 mmHg over the region 50 mmHg to 200 mmHg. The limited range resulted from the scanning limit of the piezoelectric length transducer. System linearity was approximately 5 percent. Computer noise analysis identified the high voltage DC amplifier and the piezoelectric length transducer as limiting resolution to 3 mmHg. Acousto-optic modulation was examined as an alternative control method. This approach offers better resolution and better frequency response. The performance of the prototype pressure sensing system suggests that state-of-the-art specifications could be achieved by this method. Application for intravascular blood pressure measurement is discussed. (Author)

Systematic Studies for Improving Injury Protection in Alpine Skiing and the Concept of a New Ski-Binding System (Systematische Untersuchung zur Verbesserung des Verletzungsschutzes im Alpinen Skilauf und Konzeption eines Neuen Skibindungssystems),
Ralf Storandt. 1980, 196p
Text in German, abstract in English.

A comprehensive review is presented on contemporary ski-binding engineering. It indicates that there is room for improvement in terms of injury prevention. The factors contributing to injuries are reviewed and related to ski-binding design considerations. Use is made of injury statistics and the response of the most frequently injured parts of the body to the most frequently encountered stresses in alpine skiing. It is shown that the most important factor in ski bindings is their torque-limiting capability. The major stress occurs where the leg is 'clamped' to the ski/binding assembly. A prototype of a new ski binding is developed on the basis of these considerations. It is evaluated on the basis of laboratory and field tests. It is considered that the approach employed in designing the new binding is promising, and is also capable of further improvement. Its primary advantage is that it reduces the torsional and bending stresses for the tibia of the skier. It is also easier to adjust, which is desirable since many accidents are shown to have been caused by improper adjustment of the ski binding. The dissertation cites 27 references to the literature.

Contract NO1-AM-8-2227
See also report for Nov 77-Jan 79, PB-298 970.

In a hemodialysis (HD)/hemofiltration (HF) ABA cross over study clinical and laboratory parameters were followed. In patients on long term HF treatment the compatibility of HF was studied. In single patients hemodynamic changes and concomitant changes in sympathetic acitivity were investigated in regard to volume removal during pure ultrafiltration (UF), acetate HD, bicarbonate HD and HF. The claimed benefits of HF in regard to anemia, hypertension and hyperphosphatemia could not be verified. HF with low exchange volume (18-22L) seems to be an inadequate dosage of therapy and is accompanied with a decreased urea nitrogen generation rate. The main benefit of HF is the low incidence of hypotensive episodes during treatment. The costs of HF are considerably higher than of HD. No clinically adverse effects were observed in patients on long term HF treatment. UF and HF resulted in identical changes of hemodynamics and of plasma nordrenaline levels (PNA): Total peripheral vascular resistance (TRP) increased as did PNA, resulting in a stable blood pressure. In contrast during HD/TPR remained unchanged as did PNA resulting in a decrease in blood pressure. No significant differences in regard to changes in TRP and PNA were seen between acetate and bicarbonate HD.

Contract W-7405-ENG-48
International conference on automation of diagnostic cytology and cell image analysis, Munich, F.R. Germany, 23 May 1980.

High resolution fluorescent image analysis has been conducted with mithramycin stained cells from clinical gynecological specimens. Features characteristic of the usual, low resolution, one dimensional slit-scan flow cytometric measurements were extracted from 250 high resolution nuclear images. In addition to the measurement of the usual parameters, nuclear ellipticity and DNA density (DNA per unit nuclear size) were also determined. Preliminary results indicate both these features offer increased discrimination. When nuclear shape is included as a global feature, at least 77% of the diagnostic cells can be distinguished from normals, with no overlap. Both features hold promise for improving the discrimination possible with flow cytometry. (ERA citation 06:022630)

Germination Characteristics of Six Plant Species Growing on the Hanford Site.
G. R. Cox, R. R. Kirkham, and J. F. Cline. Mar 80, 13p RHO-LD-121

Contract AC06-77RL01030
Microfiche only after original copies are exhausted.

Six plant species (Siberian and thickspike wheatgrass, cheatgrass, sand dropseed, Indian ricegrass, and Russian thistle) found on the Hanford Site were studied as part of an investigation into the revegetation of disturbed areas. Germination response to three environmental parameters (soil moisture, soil temperature, and planting depth) were measured. Results indicated that when a polyethylene glycol solution was used to control the osmotic potential of the imbibition media, no significant decrease in germination rate occurred down to -3.0 bars. However, below -7.0 bars all species experienced a decrease in germination. When germinated in soil, all species except Russian thistle exhibited a significant decrease in germination rate at -0.3 bars. Russian thistle was the only species tested that exhibited germination at a soil temperature of 1 exp 0 C. All species gave optimum germination at temperatures between 10 and 15 exp 0 C. Thickspike wheatgrass was the only species tested which was able to germinate and emerge from a planting depth of greater than 2 inches. If supplemental moisture is provided, a shallow planting would be advisable for those species tested. If not overcome by pretreatment prior to planting, seed dormancy may be a significant factor which will reduce the germination potential of some species tested. (ERA citation 06:024186)

Membrane-Membrane Interactions in a Lipid-Containing Bacteriophage System. Progress Report, October 1, 1980-September 30, 1981.
W. Snipes. May 81, 8p
Contract AS02-76EV02311

Virus-cell interactions and the mechanism of viral entry have been the major focal points of this research. A method of analysis was perfected to investigate the entry process for herpes simplex virus. This technique makes use of a photosensitizing dye, FITC, that covalently binds to viral envelope proteins. Treated virions remain photosensitive until the envelope is shed during the process of infection. Our data strongly support an entry mechanism in which the viral envelope fuses with the cell plasma membrane. Other related projects have involved studies of the virucidal properties of retinoids, plaque development characteristics for viruses surviving treatment with membrane perturbers, and a large plaque effect that occurs when virus are plated on cells pretreated with uv light. In addition, we have characterized a new bacteriophage, investigated the interactions of divalent cations and proteins with phospholipid vesicles, extended our studies of the effects of hydrophobic photosensitizers on cell membranes, and used the spin-trapping technique to elucidate the reaction mechanism for an enzyme-like activity in soil extracts. Study of Mathematical Models of Mutation and Selection in Multi-Locus Systems. Annual Progress Report, October 1, 1980-September 30, 1981.
R. C. Lewontin. 1981, 12p COO-2472-07
Contract AS02-76EV02472

During the past year, research has been devoted to two related studies of two-locus systems under natural selection and one on selection in haplo-diploid organisms. The principal results are: (1) Numerical studies were made of 2 locus selection models with asymmetric fitnesses. These were created by perturbing the fitness matrices of symmetric models whose results are known analytically. A complete classification of solved models has been made and all perturbations of these have been undertaken. The result is that all models lead to three classes of equilibrium structure. All are characterized by multiple equilbria with small linkage disequilibria under loose linkage and high complementarity equilibria under tight linkage. In some cases there is gene fixation at intermediate linkage. (2) It has been shown that selection may favor more recombination, contrary to the usual expectation, if multiple locus polymorphisms are maintained by a mechanism other than marginal overdominance. This may be the result of mutation-selection balance or frequency-dependent selection. (3) In a haplo-diploid system in which diploid males are lethal (as in bees and braconid wasps) the number of sex alleles that can be maintained depends both on breeding size and the number of colonies. Simulations show that the steady number is sensitive to the number of colonies but insensitive to the number of matings. Thirty-five to fifty colonies are sufficient to maintain very large numbers of sex alleles. (ERA citation 06:022637)

A Revised Handbook to the Flora of Ceylon. Volume II.
c1981, 522p TT-78-52029/02
Trans. of Sri Lanka Jnl. See also Volume 1, PB80-184591. Sponsored in part by Sri Lanka Univ., Peradeniya.

It is hoped that this new Handbook will stimulate active interest in the plant resources of Ceylon. Above all, it is hoped that this interest will bring about the establishment of more national parks and nature reserves in all parts of Ceylon, in order that the remarkable Ceylon flora may still have a suitable range of habitats in which to live. By this means, only the species will be able to survive for the use and pleasure of many future generations of Ceylonese and of visitors from other parts of the world. Without a great increase in such reserves, at the present rate of deforestation and bringing land under agriculture, very many species will surely become extinct in the near future, as some probably already have.

Water Temperature Dynamics in Experimental Field Channels: Analysis and Modeling,
Heinz G. Stefan, John Gulliver, Alex Y. Fu, and Michael G. Hahn. Feb 81, 191p EPA-600/3-81-008
Grants EPA-R-803686, EPA-R-804736

This study is on water temperature dynamics in the shallow field channels of the USEPA Monticello Ecological Research Station (MERS). The hydraulic and temperature environment in the MERS channels was measured and simulated to provide some background for several biological studies at the Research Station, including one of the effects of artificially high water temperatures on fish and invertebrate populations. An analysis of the temperature measurement problem, the channel temperature regime, microhabitat conditions, and temporal and spatial water temperature dynamics was essential for the investigation.

Grazing Interactions Among Freshwater Calanoid Copepods,
Sumner Richman, Scott A. Bohon, and Stephen E. Robbins. c1980, 18p WIS-SG-81-724, NOAA-81042902
Pub. in Evolution and Ecology of Zooplankton Communities, p219-233 1980.

A comparative study was carried out on the grazing interactions of four calanoid copepod species feeding on natural phytoplankton assemblages in southern Green Bay and Lake Winnebago and on algal species used singly and in mixtures. The species studied were Diaptomus siciloides, Diaptomus oregonenis, Diaptomus ashlandi, and Eurytemora affinis. Particle distributions before and after feeding were analyzed using a model B Coulter Counter interfaced to a PDP 11/20 laboratory computer, which allowed for automated analyses of particles in 128 size categories. Comparisons of the four calanoid copepods revealed both similarities and differences in their feeding behavior. (Copyright (c) 1980 by Trustees of Dartmouth College.)

Black Cod--Boom or Bust. Proceedings of a Seminar Held in Seattle, Washington on February 27, 1980,
Charlotte Henry. Mar 80, 33p WSG/WO-81-1, NOAA-81042906
Grant NA79AA-D-00054

Rising interest in the black cod fishery and escalating prices for black cod in 1979 led many people to inquire about this fishery as an alternative to more traditional fisheries. In response to these inquiries, the National Marine Fisheries Service and Washington Sea Grant sponsored an all day seminar in Seattle on February 27, 1980. Pooling the resources of the NMFS specialists and others, this seminar focused on the experience and knowledge of those involved in the black cod fishery.

Commercial Fish Landings, Washington State Ports 1971-1979.
Technical rept.,
Terry Nosho, Roland Tomokiyo, and Dale Ward. Dec 80, 25p WSG-80-4, NOAA-81042908

The Sea Grant Program advisory service function is to develop technical information in a form useful to the public. This publication provides interested groups and individuals with a perspective of the commercial fisheries in Washington and indicates the relative importance of Washington's fishery ports of landing over time. Data on commercial fish landing in Washington State ports from 1971 through 1979 are presented in order to provide an overview of the State's commercial fisheries as well as a comparison of fishery port landings during this period.

Fishing Piers - Their Design, Operation, and Use,
Raymond M. Buckley, and James M. Walton. Feb 81, 33p WSG-81-1, NOAA-81042907
Grant NA79AA-D-00054
Prepared in cooperation with Washington State Dept. of Fisheries, Seattle.

The development of a comprehensive fishing pier management strategy, encompassing such divergent concerns as structural designs, angler desires, and fishery harvest rates, is a relatively new concept in fisheries management. The Washington Department of Fisheries is making a substantial investment in establishing a number of public recreational piers with habitat enhancement structures to provide shoreline anglers in metropolitan areas with access to marine resources. Information and ideas on meeting these requirements were obtained by a survey of fishing pier facilities in Florida, California, Texas, and Washington.

Localization of Fungal Components in the Pea-Fusarium Interaction Detected Immunochemically with Anti-chitosan and Anti-fungal Cell Wall Antisera,
Lee A. Hadwiger, Jean M. Beckman, and Michael J. Adams. 1981, 7p NOAA-81050804
Also pub. as Washington State Univ., Pullman. Coll. of Agriculture Research Center Scientific Paper No. 5639. Pub. in Plant Physiology, v67 p170-175 1981.

Antisera specific for purified cell walls of Fusarium solani f. sp. pisi and phaseoli and of shrimp shell chitosan were utilized as immunochemical probes to determine the location of fungal components in the pea-Fusarium interaction. Within 15 minutes after inoculation, fungal cell wall components appear to enter the plant cell and to accumulate inside the plant cell wall as fungal growth on the plant tissue is inhibited. The accumulation patterns of chitosan and all components containing hexosamine polymers resembled those of the fungal wall components. Chitosan is present on, and is released from, the outer surface of the fungal spore. Within 15 minutes after applying (3H) chitosan to the surface of the plant tissue, the label is readily detectable within the plant cytoplasm and conspicuously detectable within the plant nucleus. It is proposed that the potential for transport of chitosan between the spores of Fusarium solani and pea cells, in addition to its potential to inhibit fungal growth and elicit disease resistance responses, suggests chitosan has a major regulatory role in this host-parasite interaction.

Analysis of Cells Isolated from Bone Cultured on Collagen Gels and Polystyrene Culture Dishes.
K. Fletcher. 1981, 225p
Contract AC02-76EV03490

Bone is a complex tissue which contains three types of differentiated cells viz., osteoblasts, osteoclasts and osteocytes. In mature bone, these cells are identified both by their location within the tissue and their morphological characteristics. In fetal tissue, one also finds many progenitor cells, fibroblasts and some cartilage cells. Each of these cell types has distinct functions which are reflected in their morphology, metabolic properties and response to hormones. Studies were also undertaken to evaluate the class of problems associated with electron microprobe analysis of the extracellular fluid space in bone. It was determined that differences in elemental composition in a small volume between cells and mineral cannot be quantitatively corrected for fluorescence, atomic number or absorption effects of the mineral. A study of the use of free-flow dialysis in the study of metal binding to protein demonstrates the anomalous behavior of mercury in this experimental approach and emphasizes the importance of a thorough examination of the control situation before protein to metal binding is examined. The Development of a Two-Dimensional Multielectrode Array for Visual Perception Research in the Mammalian Brain.
Master's thesis,
Gary H. Fitzgerald. Dec 80, 145p Rept no. AFIT/GE/BE/80D-21

A review of previous mammalian visual systems neurological and psychological research is presented. Results of previous research motivated the development of a device that would record fine grained electroencephalic data from the surface of a living mammalian cortex. A multiplexing multielectrode array has been developed and tested for this purpose. The device consists of a four by four array of electrodes and sixteen junction field effect transistors fabricated on a silicon substrate using integrated circuit manufacturing techniques. In vitro tests indicated the device is capable of detecting and multiplexing fine grained cortical signals. Technical problems with the passivation material precluded in vivo evaluation. A solution to this problem is presented and an in vivo test procedure recommended. (Author)

Analysis and Performance Evaluation of Electrocardiogram Data compression Techniques.
Master's thesis,
Melvin D. Townsend. Dec 80, 263p Rept no. AFIT/GE/EE/80D-46

EKG data compression techniques were investigated for potential real time implementation on an 8 bit Motorola 6800 microprocessor. Research indicated entropy reduction transform technique such as the Fast Fourier Transform and the discrete Karhunen-Loeve Transform were not feasible for implementation on the 6800. Two redundancy reduction (RR) techniques (TOLAN and DOWER) utilizing 2nd order difference operations in conjunction with variable length encoding were studied in detail. One such RR technique (TOLAN) was fully implemented and tested with 'in vivo' EKG data. Analysis revealed compression ratios ranging from 1.25:1 to 2.26:1. Investigation of the poor performance of the compression algorithm showed significant degradation of the 2nd order environment. It was concluded that real time EKG data compression is feasible on the 6800 but that time compression techniques which store a zero value sequence counter versus the value of zero are not efficient in a high noise environment. The Delivery of Health Services to the Indigent in Hillsborough County, A Detailed Analysis with Recommendations.
Apr 76, 174p

The medically indigent are defined as those with an income of less than $4,328 for a single person, on a graduated scale up to $16,110 for a family of 10. With that definition, the number of medically indigent in Hillsborough County FL., was 273, 255 in 1975, 40 percent of the county's population. This study assesses the characteristics of the indigent (demography, social and cultural characteristics, and health status), the types of services available in Hillsborough County, how health services are financed, and identifies problems and needs at the primary, secondary, and tertiary levels and system wide. Some of the study's recommendations include: a network of primary care clinics should be established, the use of physicians assistants and nurse practitioners should be encouraged, a 'family practice' specialty and residency should be established at the University of South Florida College of Medicine. Eight appendices show the number of blacks, Spanish-speaking, elderly, and primary care physicians (general practitioners, internal medicine, obstetricians/gynecologists, pediatricians, optometrists, and dentists) in the county, projection of acute hospital bed needs through 1990, fee schedules and services covered by Medicare and general health insurance.

Issues and Requirements for a Homemaker-Home Health Demonstration Project: A Report to the Commissioner, Georgia Department of Human Resources, Atlanta, Georgia.
Mar 79, 178p
THIS DOCUMENT WAS ANNOUNCED PREVIOUSLY IN GRA ISSUE 8113. It is being reannounced with a new corporate author.

Issues relevant to a demonstration project to train and employ voluntary participants selected from the aid to families with dependent children (AFDC) program as homemaker-home health aides in Georgia are assessed. By training and employing AFDC recipients, it is hoped that employment needs of dependent populations can be met while allowing social and health agencies to expand existing services and, in some areas, offer new services. The emphasis is on cost containment through the utilization of voluntarily selected homemaker-home health aides. Employment prospects for aides are examined in relation to the Georgia Department of Human Resources and departmental divisions dealing with family and children services, mental health and mental retardation, physical health, aging, and youth services and vocational rehabilitation and also in terms of the Veterans' Administration. A home service aide model is detailed that focuses on proposal and demonstration planning requirements, determining the need for homemaker-home health aides, manpower resource requirements, demonstration site assessments, trainee selection criteria and process, training requirements, employment support requirements, private sector employment, demonstration project funding requirements (costs and funding options), demonstration implementation requirements, and evaluation requirements. Appendixes contain further information on the demonstration project in Georgia. A list of selected references and figures are included.

Copayments and Demand for Medical Care: The California Medicaid Experience,
L. Jay Helms, Joseph P. Newhouse, and Charles E. Phelps. Feb 78, 38p R-2167-HEW
Grant DHEW-016B-7601-P2021

Zellner-type indirect regression techniques were used to assess the impact of a copayment requirement on the utilization of health care resources by the poor in California's Medicaid program. Data for the assessment came from the 1972 copayment experiment in California in which a group of Medi-Cal beneficiaries was required to make small payments for physician visits and prescription drugs, services that had previously been provided free. The sample for study included 40,662 individuals from three countries; 10,687 individuals were in the copayment group and 29,975 were not. Three constrained models were introduced that considered seasonal effects; assumed that coefficients of sex, age, and county were invariant over time; and assumed that copayment requirements had constant coefficients over time. A fully unconstrained model was also derived. The major finding of the study concerned copayment requirements in the hospital days equation. It was implied that imposing a charge of $1 per office visit increased hospital care provided per person by 0.024 day per quarter, a 17-percent increase relative to the precopayment average in the entire sample. Three possible explanations for the increased rate of hospitalization in the experimental copayment group are offered: (1) the increased rate is a statistical artifact; (2) the locus of treatment for a given mix of medical problems shifts in response to changes in relative prices; and (3) the mix of medical problems changes because those of whom copayment is required are deterred from seeking preventive or early diagnostic treatment in a physician's office. It is concluded that out-of-pocket payments for ambulatory services rendered to the poor may be self-defeating as a method of controlling health care costs. Supporting data and a list of references are included. Procedural information on the study is appended.

Availability and Distribution of Health Care Resources in the Twelve East Texas Counties; Rural-Urban Comparison,
M. A. Solliman. Mar 76, 67p INFORMATION-76-1

This study represents an investigation of the distribution of selected medical resources (medical personnel and facilities) in the twelve county region in South East Texas. In addition, the situation in terms of availability and distribution of these resources are compared with those that prevailed in 1970 and 1971 whenever the statistics are available. The data for this research were obtained from a wide range of sources: membership lists for medical associations, State licensing or examining boards, and other publications. Indices were developed from these sources and related to the population of each county. Medical personnel-population ratios at the national level were compared with state and county ratios and used as indices of availability of medical personnel.

Western Center for Health Planning, San Francisco, CA.
Concepts - Issues - Technology, Behavioral Health Planning: A Workbook of Suggested Approaches,
May 77, 160p
Contract PHS-HRA-230-76-0216
Prepared in cooperation with California Department of Health, Los Angeles. Health Training Center.

The workbook contains suggested approaches to behavioral health planning. The contents represents suggestions. The material is designed to stimulate local planning discussion and encourage communication among the participants in the planning process. The behavioral health planning activities of Health Systems Agencies impinge on long-established planning processes in which a large number of staff and volunteers have a considerable investment. The Workbook materials may be removed and reproduced for use as tools to facilitate decision making with them. Such decisions are often complicated by the fact that generalized planning guidelines, standards and criteria are not as useful to local agencies in planning for behavioral health as they may be in physical health planning.

Strengthening Information Services for Health Planning: Report of a Working Group on Mechanisms for Improving the International Exchange of Health Planning Information Held at Bielefeld, Federal Republic of Germany on June 13-15, 1978.
1978, 20p
Sponsored in part by Bureau of Health Planning and Resources Development, Hyattsville, MD.

As health ministries in many countries and private agencies and institutions in others have become increasingly committed to the health planning process, it has been brought to their attention that the experiences of one country and the lessons it has learned at the expense of human and financial resources have been difficult to transfer to others. A number of countries have established sophisticated information systems and libraries for the purpose of supporting their own national health planning programs, but the trasfer of information between and among such centers has been impeded for a number of reasons.

Benefit Recovery in the Minnesota Title XIX Program,
Beth A. Wahtera. Mar 80, 145p HCFA-20045

The Minnesota Benefit Recovery Unit was considered fully operational as of December 1975. It was at that time that system enhancements first facilitated the generation of the Health Insurance Claim form and the identification of paid invoices for which potential third party liability existed. As a result, the State's approach to TPL utilization drastically changed from the interim procedures of manually monitoring the existence of TPL to the present approach of performing post payment recovery for those invoices paid by Title XIX funds, but for which the provider has not pursued TPL. This document includes the following: (1) Provides adequate descriptions of current TPL procedures and policies that have substantially changed since the publication of the 1977 document without being of insufficient detail nor inundating the reader; (2) Provides a generalized overview of the Minnesota Title XIX program and the Benefit Recovery Unit to be used as a reference point in conjunction with the more detailed aspects of third party as contained herein; and (3) Provides detail and description of the present status of the activity, specifically the implementation of the OHC file.

Cardiac Catheterization and Surgery Services: Criteria and Standards Applicable for Reviews of the Appropriateness of Existing Institutional Health Services,
William B. Landis. 22 Dec 80, 31p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

The purpose of the Appropriateness Review Program is to determine the appropriateness of institutional health services and to recommend remedial action to insure that services in an area are appropriate for the citizens' needs. The purpose of these criteria and standards is to enable reviewing Health Systems Agencies, the Maryland Health Planning and Development Agency, and the institution under review to identify institutional health services warranting intensive review to determine appropriateness or inappropriateness.

Variations in Population-Based Use Rates and Expenditures: Implications for Manpower Policy,
John Wennberg, Richard Greene, Michael Zubkoff, and Coralea Lapenas. Mar 81, 149p
Sponsored in part by Health Resources Administration, Hyattsville, MD. Office of Graduate Medical Education.

This report was developed to support the efforts of the Geographic Distribution Technical Panel of the Graduate Medical Education National Advisory Committee (GMENAC). The GMENAC was created in April of 1976 as an advisory body to the Secretary of Health, Education, and Welfare. The committee was charged with making recommendations on the future supply and requirements of physicians by specialty and geographic location. This report addresses two charges to the Geographic Panel calling for an analysis of the relationship between variations in use and procedure rates and local physician distribution and calling for a definition of acceptable levels of variation in supply as well as use rates. A number of studies had indicated that the physician supply/service distribution relationship is a complex one and should be factored into policy decisions on the geographic distribution of physicians. This report provides an analysis of these issues.

Battelle Human Affairs Research Centers, Seattle, WA.
An Analysis of the Content of Specialty Practices and Their Service Capacities. Executive Summary.
Mar 81, 17p DHHS/PUB/HRA-81-649
Contract PHS-HRA-232-79-0088
See also HRP-0903225.

This present report compares the activities of various physician specialties which care for patients with highly similar problems. It also assesses the influences which determine the practitioner's tendency to treat more patients and devote more hours to his or her practice. It is believed that the information contained in this report should be of value to all persons interested in graduate medical education and health manpower analysis.

One of the major responsibilities of the Office of Graduate Medical Education (OGME) and its Research and Analysis Branch includes assessing and projecting physician manpower needs by specialty. In pursuit of this objective, OGME has engaged in the development and support of various modeling and analytical activities aimed at understanding practice patterns within and among physician specialties. These activities have been carried out both by OGME staff and by contract studies. One area of activity calls for analyzing a highly comprehensive data set produced for the Health Resources Administration. The data stem from a series of surveys performed by the University of Southern California and resulted in detailed practice profiles covering 24 medical and surgical specialties. This data set contains a rich source of material on physician specialty practice profiles that will require intensive analysis and assessment. The present report is among the first of an anticipated series of analyses of this data base.

Developing a Profile of Health Service Area Organizations, Groups, and Community Resources,
Elizabeth M. Farnham. May 81, 19p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

If health planning is to remain a locally controlled activity, it must continue to expand the opportunities for diverse and competing elements to be involved in the development and implementation of activities designed to achieve local, state, and national objectives. The 1979 Amendments to the National Health Planning and Resources Development Act (P.L. 96-79) made two major modifications in the requirements for composition and selection of governing bodies of Health Systems Agencies (HSAs). One specific aspect of these modifications is the identification of the variety of potential groups in a community which, either directly health related or not, represent an organized constituency and might become involved in HSA activities. Steps are outlined to guide an HSA in implementing this aspect: (1) identifying representation and specific types of information needed; (2) developing a master list of community groups and service providers; (3) collecting and storing the required information; and (4) updating and maintaining the central listing. The information which is discussed suggests some ways an HSA could go about developing a profile of community organizations in its area. There is no one combination of tools or approaches for this task which are guaranteed to provide the HSA with a complete list of all relevant groups in its area.

Study of the Allegan and Lake Dental Service Areas for Shortages of Dentists.
Dec 80, 18p

This study presents an analysis of the Allegan and Lake dental care service areas for shortages of dentists. Criteria for Designation of Health Manpower Shortage Areas published by the Department of Health and Human Services (DHHS) was used. Findings indicate both areas to have population to dentist ratio less than 5000:1; therefore, not eligible for designation as health manpower shortage areas for dentists.

Staff Paper: An Overview of Respite Care Programs.
Mar 80, 21p

This paper is an examination of different ways to develop respite care programming in area agencies. Essentially, its purpose is to stimulate implementation of these programs as called for in the Health Systems Plan (Status Goal 19 and System Objective H.1.b.). It is concluded that respite care programs provide a valuable alternative to the burdens of parental care in addressing the cost containment and prevention themes.

HRP-0903237/6 PC **A07**/MF **A01**
Western Wisconsin Health Systems Agency, Inc., La Crosse.
Alternate Care Study Report.
Dec 80, 136p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

The stated objectives of this study include: (1) collecting of data reflecting current needs of a segment of Western Wisconsin Health Systems

Area's population; (2) involving appropriate area health professionals in the development and implementation of the health systems plan; (3) providing the opportunity for work with state legislators and/or private industry to modify existing reimbursement mechanisms which promote costly and often inappropriate or unacceptable institutionalization; (4) promoting development of a wide range of alternate care services and resources for the area's population which will prevent unnecessary institutionalization; and (5) improving the health status of the area's population through more appropriate levels of care. All participating agencies recorded an assessment of each of their home health and public health nursing clients age 65+, using a slightly expanded form of the Grauer Functional Rating Scale, for a three-month period (January 1980-March 1980). The estimate of need for alternate care considers three population groups (noninstitutionalized population age 65+, nursing home residents, and hospital admissions) as potential users of alternate care services. An evaluation of each county's situation is given along with a total regional summary. Results indicate that a division of alternate care services into three basic levels of care would be more appropriate for purposes of analysis and further planning: (1) functional level indicating imminent institutionalization; (2) a level indicating that alternate care services could be instrumental in preventing or delaying institutional placement; (3) relatively high functional level and for the most part receiving basic alternate care services. Tables with relevant data and a copy of the Grauer Functional Rating Scale are appended.

Competition in the Health Care System: An Evaluation of the Pro-Competition Bills.
Mar 81, 21p

Within the context of stimulating a stronger competitive marketplace, a number of bills commonly referred to as the 'pro-competition' bills were introduced in the 96th Congress. Intensive debate of these bills can be expected in the 97th Congress. The six pro-competition bills are analyzed as a group. The following aspects are discussed in light of the group as a whole: the tax cap and rebate, the need to define the low-option plan, competition versus choice of insurance plans, multiple carrier requirements, employers who self-insure, and two-earner families. Factions who support and oppose the pro-competition bills are considered as well as amendments that might be introduced. These bills have evolved from an initial concept of enhancing consumer choice among competing plans. Many of the serious adverse effects of the proposals relate to the high-cost, low-cost plan choice, with associated tax cap and rebate provisions. A solution may be to abandon these features and revert to the original concept of competing provider plans, i.e., consumer choice of a conventional benefit plan and one or more health maintenance organizations or similar alternative care provider plans, as available in the community.

InterStudy, Excelsior, MN.
Design for a Corporate Health Care Monitoring System,
Mary M. Hunter, and John C. Rosala. Sep 80, 43p
Grant HCFA-18-97019

Although employee health directly affects a firm's productivity, many comanies have little information available on the quality or cost effectiveness of their employee health services. The lack of adequate health care utilization and cost data is a major obstacle to formulating effective long-term cost containment measures and cost-benefit analyses. A health care monitoring system can identify the costs and utilization of employee health care, can enable measurement of exceptions and trends, and can facilitate the tracking of corporate programs addressing health care costs and quality. The Corporate Health Care Monitoring System (CHCMS) described in this report is two-tiered. The system's summary level provides division managers with data on five utilization indicators (number of hospital admissions, number of hospital inpatient days, average length of hospital stay, number of surgical procedures, and number of outpatient provider encounters) and six cost indicators (premium payments, reported charges, claims paid, hospital inpatient costs, surgical expenses, and out-of-hospital costs). The detailed level's reporting capability can provide both diagnosis-specific and provider-specific information on request when summary statistics indicate a potential problem. Adaptation and implementation of the CHCMS requires the commitment of adequate resources for design, testing, installation, and evaluation of a local system. Summary report formats, sample calculations, and sample diagnostic categories are appended. An executive summary is included.

Western Wisconsin Health Systems Agency, Inc., La Crosse.
Western Wisconsin Health Systems Agency Hospital Bed Need Task Force Final Report.
Mar 81, 77p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

The Task Force combined statistical study with a series of public meetings to analyze needs for acute care hospital beds in the predominantly rural area. Study of data indicates declining utilization due primarily to decreased length of stay as well as a decline in admissions to rural and an increase in admissions to urban facilities. The Task Force rejected normative bed need approaches in favor of stochastic methodologies, which recognize that daily census is more variable in smaller facilities and requires a lower occupancy rate .Using a model developed by the Wisconsin Hospital Association, actual census data for general/medical/surgical, obstetrical, pediatric, and intensive care services was applied to five statistical distributions to determine the one most closely fitting actual distribution. This distribution was then employed to project needs using the following probabilities for not having beds available when needed: 1 percent of the time for obstetrial beds and 2 percent for the other three services. For most other services and for facilities not submitting census data, the Poisson-Normal formula was used. Fifteen percent of the area's beds are unneeded. Nine recommendations for dealing with excess capacity are specified, as are five recommendations for improving the viability of community hospitals. Appendices include the Task Forces's charge, tables, graphs, maps, and charts.

Health Planning Council of the Midlands, Omaha, NE.
Guide to Project Review Procedures and Criteria. 1980 Edition.
23 Oct 80, 171p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

The Health Planning Council of the Midlands (HPCM) utilizes the health systems plan and annual implementation plan to provide the basic set of community values and priorities to be used when making recommendations regarding proposed health facilities and services. The project review operating procedures specify the membership and functions of the review committee and guidelines for conflict of interest. An outline for determining nonsubstantive reviews and summary reviews is provided. Roles and responsibilities in the review process are discussed for the applicant, the review team, the project review committee, and the HPCM executive committee. Policies are provided for staff consultations with potential applicants and for agency decisions, findings, recommendations, reports, and files. Evaluation techniques for general assessment are in the form of checklists and questionnaires to be completed by the review team assigned to the project. Sixteen general criteria for review and guidelines and criteria for feasibility analysis are listed. Sample formats are included for reporting staff findings and recommendations. Thirty-one terms relating to health care facilities, resources, and 'persons' are defined. The appendix consists of criteria and standards for 19 health care services: occupational health and safety; individual health protection; detection; pediatric; obstetrics; surgery; diagnostic radiology; therapeutic radiology; emergency medical; dental health; mental health, alcoholism, and drug abuse; general medical; habilitation/rehabilitation; maintenance; personal health care support; health education; cost containment; and acute care bed need determination.

George Washington Univ., Washington, DC. Intergovernmental Health Policy Project.
A Legislative Snapshot: Medicaid Legislation: Eligibility, Service Coverage Reimbursement and Administration,
Kathleen A. Brennan. 1980, 19p
Grant PHS-18-P-27

Title XIX of the Social Security Act requires state Medicaid programs to provide a certain level of coverage and eligibility; beyond that, however, states are given great leeway to determine the configuration of their programs. Twenty-one states enacted 40 separate pieces of legislation pertaining to medical assistance eligibility, service coverage, reimbursement, and administration during the 1979 session. The changes wrought by the legislatures on the administrative organization of Florida's department to a reduction in the counties' contribution to Nebraska's medical assistance program. California, Hawaii, Idaho, Illinois, New Hampshire, New York, and North Carolina all examined the reimbursement process set up in their Medicaid legislation and made alterations in the mechanism. Evidence of legislative involvement in the scope of services can be seen in state authorizing and appropriating legislation in 1979. Medicaid eligibility standards were altered in 1979 by a number of states that either changed categorical groups or income/asset ceiling. A state-by-state summary of 1979 enactments relating to Medicaid is provided.

Medigap: States Responses to Problems with Health Insurance for the Elderly,
T. Van Ellet. c1979, 67p
Grant HCFA-18-27

The many deficiencies in the Medicare program are briefly elaborated in an effort to explain much of the Medigap abuse taking place today. Due to these gaps in Medicare funding more elderly over age 65 are turning to private health insurance. Types of policies offered to the elderly fall into three categories: the Medicare supplement policy (including major medical policies), the indemnity policy, and the limited, or dread disease , policies. various marketing abuses/tactics by insurance agents are explained. The National Association of Insurance Commissioner has promulgated generic model regulations about the sale of health insurance that also affect health insurance for the elderly. These include: (1) unfair trade practices act; (2) advertising; (3) policy holder complaints; (4) premium rate controls; (5) minimum standard requirements; and (6) policy readability. Selected actions taken to regulate the sale of private health insurance are briefly summarized for 18 states. Results from an independent survey of state insurance department officials are presented to gain insight into their attitudes and opinions about Medigap problems. Forty-two of fifty departments surveyed responded. Possible actions by states can be broken down into five general areas: investigation of private health insurance; insurance policy benefits and content; insurance agent activities; insurance company activities; and consumer information activities and disclosure. Specific state laws and regulation regarding Medigap are tabulated and appended.

Suburban Cook County-Dupage County Health Systems Agency, Inc., Oak Park, IL.
Procedure Manual for Appropriateness Review,
Feb 81, 78p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

Health Systems Agencies (HSAs) are required by section 1513(g) of the Public Health Service Act to conduct appropriateness reviews of existing institutional and home health services. Reviews are performed on an areawide basis, with findings reported to the State Health Planning and Development Agency (SHPDA). Each review addresses a

category of service, with definitions of categories and review sequences established by the SHPDA. This manual outlines procedures for the following aspects of an appropriateness review: (1) notification of beginning of review; (2) information requirements; (3) format and findings; and (4) public participation, including public hearing and reconsideration of HSA recommendations or findings. The appendix includes the current schedule for Suburban Cook County-DuPage County HSA appropriateness review, a sample appropriateness review cycle, the schedule for state (SHPDA) appropriateness review, definitions of categories of service, and review criteria and standards for the following: general criteria and standards (5 criteria, 5 standards); end stage renal disease (10, 15); cardiac catheterization (8, 12); cardiac surgery (12, 14); therapeutic radiology (8, 17); transmission computerized tomographic scanning (10, 15); acute mental illness (16, 28); chronic mental illness (12, 20); alcoholism treatment (17, 27); burn treatment (11, 13); and rehabilitation (12, 28). No sources or discussions of rationale are provided for these criteria and standards.

A 'Snapshot' of 1979 State Health Insurance Legislation: Administrative and Fiscal Regulation,
Peter E. Carlin. 1980, 25p
Grant HCFA-18-27321

Since the enactment of the McCarren-Ferguson Act of 1945, state legislatures have addressed a myriad of issues pertaining to health insurance. The functions of state insurance departments, which have traditionally focused on administrative and fiscal oversight of the insurance industry, generally include: ensuring that rates are not excessive or unfairly discriminatory; licensing companies and their agents; maintaining a system of financial and trade regulations; examining a company's financial condition and claims practices; and applying for a court order in the event of liquidation, rehabilitation, or conservation of a company. In 1979, twenty-nine states enacted statutes relating to the administrative and fiscal regulation of health insurance. Six states passed legislation with respect to monitoring the financial health of insurance companies. Administrative regulation of health insurance companies was the subject of 13 state laws, the bulk of which grant insurance departments enormous power in regulating health insurance plans. Other prominent issues addressed were minimum standards for language used in insurance policies, contracts, and certificates; the confidentiality of an insured's records; the overall effectiveness of health insurance legislation; and the problem of establishing guidelines for conversion policies. A state-by-state summary of 1979 legislation related to health insurance is included.

Health Systems Agency of Northeast Florida Area 3, Inc., Jacksonville.
Hospitalizations in Northeast Florida, 1978,
Feb 80, 24p
Prepared in cooperation with Bureau of Health Planning, Hyattsville, MD.

This is one in a series of annual reports on acute care civilian hospital services in Northeast Florida. This report describes where area residents go to recieve hospital care within Florida Health Service Area No. 3, as it was originally designated. The 'patient origin' report covers hospitalizations in Baker, Clay, Duval, Flagler, Nassau and St. Johns Counties during calendar year 1978. Volusia County was added to Area 3 in July, 1978. Since Volusia County statistics are not yet available it will not be covered in this report. It should be further noted that hospitalizations of area residents in facilities outside the planning area are not included in this report. The data presented in the following tables have been derived from a computerized hospital usage study in which all area hospitals participate.

Michigan Dept. of Mental Health, Lansing.
A Response to the Report of the Governor's Committee on Unification of the Public Mental Health System.
28 Mar 80, 53p

The Governor's Committee on Unification of the Public Mental Health System submitted its final report to the Governor on January 30, 1980. The Department wishes to thank the Committee for the devotion it exhibited in defining the structure and functions of a model public mental health system. The recommendations emanating from this Committee constitute a thoughtful and reflective process. As directed by the Governor, the Director and other personnel of the Michigan Department of Mental Health closely followed the work of the Committee. On February 6, 1980, the Department released a preliminary response to the Committee's final report. A more extensive analysis of the final report's eighty recommendations is now presented.

HRP-0903260/8 PC **A03**/MF **A01**
Michigan Dept. of Mental Health, Lansing.
Into the 80's: The Report of the Governor's Committee on Unification of the Public Mental Health System.
Final rept.,
30 Jan 80, 39p

The Governor's Committee on Unification of the Public Mental Health System recommends establishing a single point of responsibility for voluntary and involuntary entry into Michigan's public mental health system, for determination and oversight of the services it provides, for system exit, and for the resources that support services delivery. That single point of responsibility is to be located in the community. It is designated as a local mental health authority encompassing one or more counties. Greater responsibilities than are now possessed by community mental health programs are recommended for each authority. Greater authority, including the control of its direct service personnel and fiscal resources, is recommended for the authority.

Johns Hopkins Univ., Baltimore, MD. Dept. of Health Services Administration.
Excess Mortality Risk in Baltimore City by Regional Planning District and Census Tract 1969-77.
Final rept.,
Monroe Lerner. 30 Apr 80, 180p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

As a necessary first step in planning public health programs, Health Systems Agencies are expected to identify populations within their areas at excess risk of ill-health and to identify its determinants; this is usually to be done, at least initially, by using data routinely available to the Agency. The present report provides the results of one such effort in which populations and areas at excess mortality risk in Baltimore were identified for the nine-year period 1969-77 (and each of its three three-year components) for the total population of Baltimore, by age, by race, by sex, and for 23 major causes of

death. Excess mortality risk was, in turn, separated into severe, moderate, and mild categories of excess risk. Both Regional Planning Districts (RPDs) and individual census tracts constituted the units of analysis.

Population-Based Measurement of Hospital Use in Maine Areas, 1976,
David Soule. Dec 79, 97p
Contract PHS-HRA-230-76-0298
Prepared in cooperation with Maine Health Data Service, Portland.

This report is the culmination of a series of analyses that began in 1968 with collection of patient origin data, definition of geographic areas for analysis of hospital use, computation of area admission rates to hospitals, and computation of distributions of admissions to local and non-local hospitals. The basic findings from the 1968 data are set forth in a 1969 report published by the Health Facilities Planning Council, Patient Origin Study 1968: An Analysis of Data on Maine Towns, Populations, Hospitals and Admission. The work that went into that first patient origin study was expanded to collection of 100% discharge data from all Maine hospitals, further applications of the area concept and definitions, and computation of population-based (epidemiologic) rates of hospital use by the residents of the various areas. Some of the data from the 100% file were published in an updated patient origin study, issued in 1977 by the Maine Health Data Service.

Heath Care Cost in Delaware: Report to the Governor.
Jun 77, 18p

The complexity of the financial system of health care cost is such that, from consumer to physician or hospital administrator, no one seems able to contain the rising costs. All agree, however, that steps must be taken almost immediately to contain these increases. This report seeks to address the existing dilemma by examining the nature of these cost increases; and, suggest ways in which Delaware, its citizens and its government, may contain the tide of rising health care costs.

Planning Mental Health Programs and Facilities: Under Public Law 93-941.
1978, 60p

In this publication an attempt has been made to provide information about the multiples related to the planning for mental health programs and facilities under the National Health Planning and Resources Development Act (PL 93-641). There are no established answers, but there are commonalities--especially in the area of Certificate of Need and the roles of the SHCC and the SHPDA. There are also some considerable differences in the evaluation of the cost factors and also in the review processes conducted by the Health Systems Agencies. The general health and mental health systems are different systems but they are also compatible with each other. The information is provided to give basic background to be used by all parties in planning for mental health programs and facilities at both the local and state levels.

The Mental Health Aspects of Health Planning.
1977, 64p

There is need for both the staff persons and governing body members of the health planning agencies and the staff persons and board members of local and state mental health agencies to have a clearer notion of the mental health aspects of health planning so that this aspect can be as effective as possible. This publication explains some of the differences in perspectives between general health and mental health, some of the organizational differences, some differences in definitions, and some of the differences in service delivery.

Nebraska Health Manpower Reports: Nursing Home Administrators 1978.
1978, 20p
See also HRP-0016420.

The data contained in this report were collected by questionnaires mailed to each Nursing Home Administrator licensed by the State of Nebraska as of February 1, 1978. The total number of licensed Nursing Home Administrators on this date was 482, of whom 415 were either employed in Nebraska or retired and residing in Nebraska. These 415 Nursing Home Administrators - and, more specifically, the 359 who were employed in Nebraska on the above data - constitute the statistical population for the major portion of this report. Annual surveys of thirteen licensed health professions are conducted by the Division of Health Data and Statistical Research of the State Department of Health, in order that timely and reliable data concerning the supply, distribution, and characteristics of health manpower in Nebraska may be made available at the State and local levels. In addition, information from these surveys is forwarded to the National Center for Health Statistics for inclusion in the Cooperative Health Statistics System at the national level. This report contains primarily summary data relating to Nebraska Nursing Home Administrators in 1978.

A Statistical Profile of Population, Health, and Health Resources Characteristics in Region 1B: Ambulatory Care Study Part I,
Peter J. DeGuire, and Jean C. Aldag. Sep 78, 129p
See also HRP-0903275 and HRP-0903276.

This report examines a large volume of data on demographic, socioeconomic and health characteristics of the Region 1B population and various aspects of the health delivery system, including health resources and selected health care expenditures and utilization statistics. Whenever possible, these data were assembled for the State, Region and individual counties within the Region to permit comparisons between geographic areas. The main purpose of this investigation was to assess the relative status of the Region 1B population and subpopulations on various indicators relevant to the need for health services and resources. Each of the seven sections of this report consists of a summary of major findings, statistical tables and a brief expository text for each table. The intent of this report was primarily descriptive, so the major focus of the analysis of the data was on identifying general patterns, the most salient characteristics and variations between and among geographic areas, population groups and time periods.

A Survey of the Use and Need for Health Services Among the Population of a 13-County Area in Region 1B: Ambulatory Care Study Part II,
Peter J. DeGuire, and Jean C. Aldag. Sep 79, 119p
See also HRP-0903276 and HRP-0903274.

This report presents the results of a household sample survey which was conducted from May through July in 1978. This survey has produced information which was previously unavailable on the health and the utilization of health services among the population of a 13-county area in Region 1B. The main elements of this study will describe the types and volume of health care received, the characteristics of users, consumer satisfaction with various aspects of care and health status indicators. Most of this analysis focused on care received from a physician on an outpatient basis. This report is the second in a series of studies which are primarily intended to guide the development of an ambulatory teaching facility by the Peoria School of Medicine. It is also hoped that the information generated by these studies will be of use to all persons concerned with planning health services and resources in this area.

A Survey of the Practice Characteristics and Work Patterns of Physicians Within a 13-County Area in Region 1B: Ambulatory Care Study Part III,
Peter J. DeGuire, and Jean C. Aldag. May 80, 86p
See also HRP-0903274 and HRP-0903275.

This is third report in a series of studies which are intended to serve as a basis for the planning and development of ambulatory programs at the Peoria School of Medicine. This report provides data, which were derived from a sample of the population, on the patterns and perceptions of care received and the health status of consumers of health services in this area. In the consumer survey, it was found that 85% of the population of this area contacted a physician on an outpatient basis during the year. Data on the practices and the care provided in the offices of physicians, therefore, constitute a crucial component of the information base needed to describe the structure and process of health care delivery in this area. Most of the data assembled in this report have not been available previously. It is hoped that the information presented in this report will benefit other local professionals in the health field who are involved in the analysis, development and provision of health services.

Massachusetts Health Care Expenditures Fiscal Years 1973-1977: A Report of the Massachusetts Funds Flow Project,
Anestis J. Ghanotakis, and Helena Queeley. 15 Nov 80, 334p

This report is one in the series of reports of the Massachusetts Funds Flow Project. That project is an ongoing effort of the Office of State Health Planning of the Massachusetts Department of Public Health, with the assistance from other state agencies and the state's Health Systems Agencies (HSAs), to describe and analyze health expenditures in the Commonwealth. The Funds Flow reports are tabulations of health expenditures by source and type of expenditure, initially for fiscal years 1973 to 1976. They compare the relative magnitudes and trends among categories of health expenditures, and compare Massachusetts health expenditures with national levels.

Contract PHS-HRA-231-77-0114
Prepared in cooperation with Urban Systems Research and Engineering, Inc., Cambridge, MA. See also HRP-0903282.

California has had two Certificate of Need programs. The first, enacted in 1969, was a weak program that covered relatively little and was administered regionally. It did, however, establish a precedent, which was considerably expanded in a new law, passed in 1976 and subsequently amended in 1977. The second Certificate of Need program, which was centralized at the state level, consists of two processes. One category of projects, mostly involving new beds or equipment, requires Certificate of Need approval. Another category of projects, involving replacement or renovation of existing facilities, is exempted from C/N review. Expenditures for the latter category, which was exempted because of active industry lobbying, amount to far more each year than costs for the reviewable category of projects. Most observers agree that if the state is to conform to the provisions of P.L. 93-641, it will be necessary to amend the existing law considerably further.

Maryland's Certificate of need (C/N) program has reached an important crossroads in terms of development of credibility among providers and others interested in health care regulation. The program went through a long period of very slow development where planning agencies familiarized themselves with the issues, but lacked technical or political resources to evaluate or control resource growth. With the reorganization to PL 93-641 structures, the state agency and the HSAs now have the procedures and criteria in place which allow them to perform adequate technical analysis. However, the long history of planning's impotence and the lack of political resources make it unclear whether the C/N program can ever have more than a margina impact on resource allocation.

Massachusetts' DON program has been in the forefront of all C/N programs since its beginnings in 1974. The program has a reputation for toughness, seemingly verified by all interviewed observers. Most recently, 7/11/77 to 3/78, 81 applications were acted upon, 67 were approved (83%) and 14 were denied (17%). A more detailed breakdown of the 1972-76 DON decisions for acute-care hospitals is included in the report. According to the staff of the DON agency, the 'savings' from the program total $2.9 billion (assuming that denied and withdrawn projects would otherwise have been built and operated over a standard 40 year life as planned).

Minnesota is a state which will cause even the most entrenched cynic to reconsider his/her view of the merits of planning in health care. In the face of evidence from other settings that planning is not functioning well, Minnesota has somehow found the formula to make it work. The pieces which fit together to create this situation are not easily quantified. In the first place, much of the success in health planning in Minnesota can be attributed to, as one observer put it, 'the political culture' of the state. Minnesota has a long tradition of community planning and consensus building. There is a willingness on the part of all participants to listen and reason together. The environment is strongly supportive of cooperative efforts. Consumer groups and the media actively endorse the planning philosophy. Providers too, have not only accepted planning as a way of life, they have embraced it.

New Jersey's Certificate of Need Program has been operational since 1971. The enabling legislation was passed in May of 1971, but did not take effect until August of the same year, some three months later. During this lag, a number of facilities were able to obtain exemptions from the review process. According to one source, the lag allowed applications for 2108 new beds, submitted by 20 hospitals, to be exempted from C/N review. An estimated one thousand hospital beds were added in areas where planners had already identified a surplus, as a result.

The Certificate of Need program in North Dakota is characterized by a high project approval rate, strong provider domination of the project review process and generally ineffectual consumer representation. The original C/N statute was enacted in 1971 due largely to the support of the state's providers, notably the Hospital Assocation. Their support of C/N developed as federally mandated programs seemed imminent. The legislation, which providers supported, and which eventually became law, was a weak, manipulable statute subject to wide interpretation in implementation. The program which has evolved from the original law has only recently shed the 'paper tiger' role and has started to take on a more planning- and regulation-oriented stature.

Prepared in cooperation with Urban Systems Research and Engineering, Inc., Cambridge, MA. See also HRP-0903289.

Rhode Island was one of the first states to adopt a Certificate of Need program. The law, passed in 1968, grew out of the recommendations of a special legislative Commission appointed to investigate hospital room rates, primarily how they were affected by unoccupied beds. The law, which was fashioned on the concept of franchising hospitals, created a Health Services Council to review C/N applications and to advise the Director of Health as to their disposition. The new program was very slow to get on its feet for a variety of reasons, including a lack of budget, staffing and leadership. Implementation of the program as it currently exists did not really take place until 1972, when formal procedures were adopted and full-scale reviews began.

Prepared in cooperation with Urban Systems Research and Engineering, Inc., Cambridge, MA. See also HRP-0903290.

South Carolina was the first southern state to adopt a Certificate of Need program, although the forces leading to its adoption there were seemingly much the same as those at work in states geographically removed and economically different from it. In South Carolina, the enabling legislation was initially proposed by the state Hospital Association (SCHA), which steered it through the legislature. Primarily, the Association was interested in encouraging better planning by hospitals, was concerned about the threat of competition from private entrepreneurs (particularly for-profit organizations or individuals), and thought it saw the writing on the wall with regard to federal intervention if regulatory action were not taken at the state level.

Cancer Control: A State Health Plan for Massachusetts,
Lucinda G. Lagasse, and Thomas B. Devins. Jun 80, 68p
Grant NO1-CA-16408-03S1
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

As a result of the dramatic change in mortality and morbidity patterns since the turn of the century, cancer has assumed a rank as one of the highest

public health priorities during the past several decades. In spite of significant improvements in our ability to treat and cure several kinds of cancer there has been a slow but steady increase in the incidence and mortality rates of other cancers, in particular lung cancer. Cancer remains the second leading cause of death in Massachusetts and nationally; within Massachusetts 22.4% of deaths in 1977 were due to cancer. Nationally, it is estimated that one out of every four persons now living will eventually die of some kind of cancer, and that over the years, cancer will strike in approximately two of every three families.

Rural Health Care Development in Ohio; A Qualitative Analysis.
Data analysis series no. 3,
Barbara J. Cooke. Jan 81, 75p
Grant PHS-05-P-000296-BP-P25

Although problems of rural health care have been addressed by the government and the public sector, many rural Ohio areas remain underserved. With the potential physician surplus, it is important to identify these areas and to foster expansion of delivery systems in these rural areas. The recruiting of physicians to rural areas is affected by the actual process of choosing a practice location, the existing medical system, and the extent of recruitment activities. The characteristics of the population, its health care resources, and existing sociopolitical forces are among the factors which shape a rural health care delivery system. Although Ohio's rural population has grown at a faster rate than its urban population, physicians and health care facilities remain concentrated in metropolitan areas. This disparity between need and access to care in rural areas can be remedied through efforts of appropriate state agencies. Activities such as technical assistance in order to solicit grant monies, assistance in constuction of primary care centers and other facility development, and selective funding to medical schools all affect the availability of services. In addition programs to ensure maximum effectiveness and to prevent duplication of services. Maps, tables, notes, and bibliographies are included.

Grant PHS-HS-03710
See also PB81-213951. Doctoral thesis.

Materials pertaining to the implementation of Early and Periodic Screening, Diagnosis, and Treatment (EPSDT) under Medicaid provided a vehicle for approaching the dual objectives of this study: (1) to devise a framework for the study of policy implementation; and (2) to achieve improved understanding of the ways in which special interest groups participate in processes of implementation. A developmental research design was employed to document and analyze the involvement of organized special interests in negotiations for resources and influence associated with EPSDT from 1970 to 1978. Findings suggest that implementation of EPSDT was less a function of nominal policy (the law) per se than the balance of power among parties to its interpretation. Fundamental shifts in principles of policy are recommended which feature universal eligibility and adoption of measureable outcome objectives as guides to child health policy formulation and implementation. A framework for studying the behavior of organizations in policy implementation is presented which suggests that the behavior of interest groups is a function of both policy process and organization variables.

Early and Periodic Screening, Diagnosis, and Treatment (EPSDT) under Medicaid is the largest single publicly-sponsored child health program ever undertaken in this country. Created by unheralded sections of the Social Security Amendments of 1967, EPSDT aims to detect and treat correctable conditions in poverty level children and to re-screen children periodically to ensure the maintenance of good health. All persons under age 21 who are eligible for Medicaid are entitled to EPSDT services. At this time, approximately 12 million children are eligible for the program. Unlike other Medicaid services, EPSDT requires states to inform eligible persons about the program and to assure that services needed are available; as with other Medicaid services, payments to providers for services rendered are derived from a combination of state and federal financial support. EPSDT represents a significant extension of health care benefits to poor children as a matter of statutory right.

In an attempt to delineate factors responsible for graft failure, we have developed an experimental model in the Spanish Brush goat using subcutaneous grafts and implantable electromagnetic flow probes allowing sequential hemodynamic flow measurements and hematology/coagulation studies. Surgical implantation of bovine grafts (BG), reinforced bovine graft (RBG), Gore-Tex graft (PTFE), and Johnson & Johnson experimental Anisgraft (J&J) were performed on female goats. The grafts were placed in the carotid-jugular position with implantable electromagnetic flow probes placed around the grafts. Routine dialysis both in nephrectomized animals and those with functional kidneys were performed. Baseline flow rates in 12 animals averaged 1778 ml. per minute (range 520-2000). The gradual progressive decrease in blood flow was seen until thrombosis occurred. At necropsy, clotted grafts were observed to have junctional outflow stenosis due to neointimal hyperplasia. Coagulation studies were performed on goats with grafts in place with an without dailysis. Increased platelet activity was demonstrated in some goats with clotted grafts with loss of the biphasic response in platelet aggregation studies. The fibringen was significantly increased in functioning bovine grafts over control values. The remaining coagulation studies did not differ significantly from the control values.

Somboon Vachrotai, Jae-Mo Yang, David A. Edelman, Edwin B. McDaniel, and Dibya Shree Malla. 1979, 220p AID-PN-AAH-605

The seminar was attended by 48 participants and resource persons and 11 observers, representing 10 countries of East and Southeast Asia. Its objectives were three-fold: (1) to provide a forum for exchange among health/fertility professionals of experiences and research either completed or ongoing in the participating countries; (2) to enhance their awareness of IFRP's activities; and (3) to help define regional needs in contraceptive safety research, introduction and transfer of new technology, and maternity health research. This report of the seminar summarizes its proceedings and group sessions, and contains the text of 29 papers--nine country papers and twenty professional documents.

Grant PHS-HS-03404
See also PB81-215543, part 1.

This report is a guide to information needed by planners and administrators in assessing the cost-effectiveness of community health centers (CHCs). The guide is the first resource to cover both published and unpublished research and related materials, done between 1965 and 1980, on the effectivess of CHCs. Included are research syntheses and an annotated bibliography focusing on the client groups served by CHCs and on the various administrative, programmatic, and resource considerations that affect both costs and quality of care. A schematic outline shows some of the major criteria used in evaluating CHCs, along with indicators and sources of those criteria. Also included is a detailed description of the unique functions and services that CHCs provide. The new guide provides a useful research framework for studying cost-effectiveness and should be especially useful to CHCs in planning recommendations and project review decisions.

Provider Response and Cost of Dentistry for the Elderly.
Executive summary rept. 1 Jul 78-31 Dec 79,
Peter Milgrom, Douglas Conrad, and H. Asuman Kiyak. May 81, 6p NCHSR-81/129
Grant PHS-HS-02179

This research estimates costs of providing dental care to the elderly under insurance. Results suggest that incremental changes in co-payment levels and comprehensiveness do not lead to increases in cost. These results are different than previously published estimates. Data are presented which is of value in designing cost-effective insurance benefits for the elderly. Other studies which are part of this research probed the sources of variation in dentist treatment planning prediction of dental need, and demand for services among the elderly.

Provider Response and Cost of Dentistry for the Elderly.
Final rept. 1 Jul 78-31 Dec 79,
Peter Milgrom, Douglas A. Conrad, and H. Asuman Kiyak. May 81, 174p NCHSR-81/130
Grant PHS-HS-02179

The purpose of this research was to estimate the costs of providing dental care to the elderly in an experimental setting using typical patient problems. Practicing dentists prepared treatment plans, constrained by patient and insurance resources. A total of 346 practicing dentists completed two treatment plans for one of seven prototypic patients The first treatment plan was made ignoring finances and served as a control for the individual dentist's treatment style; a second treatment plan was made under one of four insurance plans. The patients were selected to be broadly representative of types of problems presented by the elderly who have some teeth. The insurance plans are typical commercial plans without deductibles and carrying co-payment levels of from 50, 50, 50, to 100, 100, 100 for Class I (preventive diagnostic), Class II (basic restorative and surgical); and Class III (prosthetic) benefits.

An Amine Accelerator for Colorfree Curing of Cold-Curing Methyl Methacrylate Denture Systems.
Final rept.,
H. Argentar, J. A. Tesk, and E. E. Parry. May 81, 2p
Contract PHS-DE-02159-02
Pub. in Jnl. of the American Dental Association 102, p664-665 May 81.

The various methacrylate denture systems used in dentistry employ differing amounts of amine accelerators for producing a cured denture. The most generally used amine is N,N-dimethyl-p-toluidine (DMPT). Upon curing, this imparts an undesirable yellow color to the resin, thereby rendering it impossible to obtain a satisfactory match of some shades between systems. A recently commercialized amine, N,N-dimethyl-p-t-butylaniline (DMBA), was tested and found to impart no color to specimens of denture resin as a result of the polymerization reaction. With the addition of a suitable quantity of a commercially available ultraviolet absorber, specimens containing DMBA exhibited satisfactory color stability when exposed to a sunlamp for 24 hours according to an American Dental Association specification for denture base resins. If used in a denture base formulation, DMBA has the potential of allowing consistent shading from one system to another. This is of value from economic as well as esthetic consideration.

Vital Statistics Mortality Multiple Cause of Death, Detail, 1977.
Data file,
Harry Rosenberg, and Joseph D. Farrell. 1977, mag tape NCHS/DF-81/007
Source tape is in EBCDIC character set. Tapes can be prepared in most standard 7 or 9 track recording modes for one-half inch tape. Identify recording mode desired by specifying character set, track, density, and parity. Call NTIS Computer Products if you have questions. Price includes documentation, PB80-126634, and PB81-217390.

Vital Statistics data relating to mortality provide demographic, underlying and multiple cause-of-death data for deaths occurring during the calendar year. The data are based on information abstracted from all death certificates filed in vital statistics offices of each State and the District of Columbia. Death is defined as the permanent disappearance of any evidence of life at any time after live birth, therefore, data relating to fetal deaths are not included in the data. Demographic data include variables such as date of death, age, race, sex and geographic area. Underlying cause-of-death data and multiple cause-of-death data have been coded to the causes shown in the Eight Revision of the International Classification of Diseases, Adapted for Use in the United States. Death and infant mortality rates are not on the tapes. The number of deaths and infant mortality rates for selected demographic and cause variables are published annually in Vital Statistics of the United States, Volume II, Parts A and B. A technical appendix giving information regarding the historical aspect and limitations of the data is included in the published volumes and the documentation for the data tapes. Specialized reports are published periodically in Vital and Health Statistics. Multiple cause-of-death data at the 'each cause' level of detail is included as Appendix I of the multiple cause-of-death documentation.

Physician Behavior Under the Medicare Assignment Option.
Final rept.,
Janet B. Mitchell, and Jerry Cromwell. 30 Jan 81, 84p
Contract HCFA-500-78-0051

Policymakers have become increasingly concerned over the growing number of physicians who are unwilling to accept Medicare patients on assignment. The national sample of general practitioners, internists, and general surgeons confirmed this reluctance: Over one-quarter (28.2%) of survey physicians stated that they never accept assignment of any of their patients; a smaller number (18.9%) report that they always do. The remaining physicians pick and choose their assigned patients on a case by case basis. Econometric analysis showed that assignment rates were very sensitive to reimbursement and administrative practices under Medicare. A ten percent increase in the prevailing charge, for example, raised assignment by 14.7 percent. Higher carrier rates of reduction and higher claims denial and investigation rates significantly depressed assignment. The assigned and nonassigned components of the Medicare program were found to compete with each other; assignment rates were lower where the demand for nonassigned services was stronger. As for the kinds of physicians who take assignment, they were disproportionately general surgeons and foreign medical graduates.

A First-Order Characterization of Clinical Trials.
Final rept.,
Marsha D. Hopwood, John C. Mabry, and William L. Sibley. c1980, 100p R-2653-NIH, NIH/DRR-77-2
Contract N01-RR-8-2122

This report presents a broad characterization of clinical trials, their organizational, administrative, and operational problems, and some tentative solutions. It reports the results of the first year of a two-year project entitled 'Evaluation of the Role of Clinical Research Centers in Clinical Trials, with Emphasis on Information Processing.' The second year of the project focused on the clinical trials role of the General Clinical Research Centers (GCRCs) sponsored by the National Institutes of Health (NIH), and recommended methods to facilitate trials that make use of the resources provided in the GCRCs. The clinical trials of interest for this broad characterization are primarily those sponsored by the NIH. The NIH Inventory of Clinical Trials for fiscal years 1975 through 1978 lists between 782 and 1,065 active trials each year, more than half of which were supported by the National Cancer Institute (NCI).

Family Planning Clinics Can Provide Services at Less Cost but Clearer Federal Policies are Needed.
19 Jun 81, 85p HRD-81-68

In fiscal year 1980, the Department of Health and Human Services spent about $375 million for family planning services through several programs. The Department could reduce the costs of such programs and make services less costly and more attractive to clients without compromising quality care by eliminating unnessary medical procedures or tests. The cost of the title X program could be further reduced by more vigorously enforcing fee collections to ensure that only needy persons receive free or subsidized services. Also, the Department needs to resolve conflicts in fee policies between the title X program, which requires fee collections from persons with ability to pay, and the title XX program, which permits free service regardless of client income.

Psychosocial Influences on Patterns of Prenatal Care Among Rural Alabama Black Women.
Final rept.,
Anna Kline, and Elizabeth Meese. May 81, 113p MCH/CCS-81/04
Grant PHS-MC-R-010429

The purpose of the study was to obtain a better understanding of the bases underlying the decisions of rural Black women regarding health care during pregnancy. Subjects of the study were 208 Black pregnant women residing in six rural counties in West Alabama. Data were obtained by means of two interviews conducted with each woman during her pregnancy and within one month following the delivery of her baby. The level of knowledge possessed by participants in the study about the physical changes and health care requirements of pregnancy was found to be seriously limited. One consequence of this was that women frequently responded inappropriately to symptoms they experienced during pregnancy, failing to refer potentially serious symptoms to a physician for treatment. At the same time it was found that their responses to symptoms experienced depended upon their perceptions of the severity of those symptoms - symptoms perceived as serious were referred to a physician for treatment while those perceived as not serious, or normal, were self-treated. Because of frequent misinterpretations of severity, however, many potentially serious symptoms were never reported to a physician.

A Checklist for Evaluative Overviews of Family Planning Program Activities.
Manual no. 6,
Jack Reynolds. Jan 73, 23p AID-PN-AAH-475
Contract AID/csd-2479
Manuals for Evaluation of Family Planning and Population Programs.

Program evaluations should be objective, systematic, comprehensive, and useful. They should be objective in the selection of topics; systematic in approach; inclusive of all studies of program activities; and establish a link between evaluation and planning. Family planning program evaluations do not always satisfy these criteria. Current family planning evaluations are frequently limited to clinic service statistics and Knowledge-Attitude-Practice sample surveys. To remedy these lapses, this report outlines the essential components of a comprehensive evaluation of family planning program activities.

Effects of Exercise Training on Lipid and Carbohydrate Metabolism in Hemodialysis Patients.
Annual rept. 1 Oct 79-30 Sep 80,
Andrew P. Goldberg. 2 Jun 81, 23p AK-1-9-2221
Contract N01-AM-9-2221
See also PB80-161623.

A longitudinal study has begun in 14 hemodialysis patients to determine the effects of exercise training on their lipid and carbohydrate metabolism, cardiovascular function, hypertension, anemia, and psychological state. All patients underwent a thorough medical and cardiovascular evaluation prior to entry to insure that none had a disability which would be a contraindication to exercise, and to evaluate their baseline thyroid function, hematologic status, and level of physical fitness. The screening exercise test was a modification of the standardized Bruce protocol. If there were no side effects or abnormal cardiovascular responses during the test, patients entered the protocol. Twelve patients underwent complete evaluations of lipid and carbohydrate metabolism, and 7 hypertensive patients were studied in detail. Investigations included determinations of: (a) lipoprotein and apoprotein profiles; (b) triglyceride turnover rates, lipoprotein lipase activities, intravenous glucose tolerance, and insulin receptor binding, number and affinity; (c) cardiac output, peripheral vascular resistance and ejection fraction; (d) catecholamine, renin, insulin, and glucagon levels; and (e) plasma volume and red cell mass. All patients had baseline psychological profiles, including assessments of mood, health beliefs, and participation in pleasant events. Dietary assessments were performed to determine their caloric intake, the composition of their diet, their cholesterol intake and P/S ratio. Six patients served as 6 month no-exercise controls and 8 began exercising immediately.

Researchers can point to mounting evidence that dentistry is gaining the scientific knowledge that will provide the public some measures for the prevention and management of periodontal disease. Dentistry has repeatedly demonstrated its willingness to support major public health efforts. Dental researchers and practitioners have actively participated in the development of the scientific base, clinical applications, and promotion of measures to control dental caries through the use of fluoride and, more recently, sealants. Now the dental research community is seeking to conquer caries totally by developing a caries vaccine. Research towards this goal is being carried out at a number of research centers, supported cooperatively by universities and the National Institutes of Health. While our scientific knowledge base for periodontal disease may lag behind that for caries, significant advances have been made in the last decade and a half by a diverse and dedicated group of scientists and concerned clinicians.

Comparative Study of the Medical-Legal Aspects of Post-Vaccination Complications in the Member States of the European Community (Etude Comparative des Aspects Medico-Legaux des Complications Post-Vaccinales dans les Etats Membres de la Communaute Europeenne),
J. M. Auby. c1981, 135p EUR-7019-FR, ISBN-92-825-2137-0
Text in French.
Customers in the European Community Countries should apply to the office for official publications of the European Communities, B. P. 1003, Luxembourg.

The significant frequency of post-vaccination accidents has led the Commission to look into the provisions covering the responsibility for the rehabilitation and compensation of victims. This concern arose from the provisions of article 118 of the European Economic Community and is all the more justifiable in that the health authorities of the Member States recommend (if not compel) all individuals of the population, or certain groups of persons, to undergo specific vaccinations against various specified diseases. In order to harmonize the legislative measures advocated in the aforementioned article and because of the free circulation of people across frontiers, it appears necessary to identify the different rehabilitation and compensation clauses in the countries of the European Community. A detailed description of the national systems in force is given which should make it possible to eliminate any existing legislative gaps from present national procedures or relevant legal practices.

Health Planning Review of Medical Information Systems.
Research rept. series 30 Sep 78-30 Jun 80,
Melville H. Hodge. May 81, 73p DHHS/PUB/PHS-81-3303, NCHSR-81-65
Grant PHS-HS-03347

This report is written in the form of a guidebook aimed at two audiences--Health Systems Agency staff or board members who must review Certificate-of-Need (CON) applications for hospital medical information systems; and, hospital executives who must prepare and submit such applications. The methododology used in preparing this document was to synthesize existing research and experience. Emphasis was placed on developing a highly readable guidebook for non-technically trained personnel rather than a formal review paper. A survey was made of all Health Systems Agencies, resulting in the review of 74 medical information systems CON applications. Total U.S. hospital expeditures for all such systems was estimated to be $200 million per year with an acquisition of medical information systems. Since each review organization has considerable latitude in establishing review forms, procedures, etc., the guidebook was prepared to deal with issues of substance rather than form. Emphasis has been placed on cooperation between the review agencies and hospitals to achieve the common purpose of acquiring only those medical information systems which will serve the public interest as defined by legislative and regulatory criteria.

Accommodation for Severely Physically Disabled Persons: A Study of the Requirements for Those in Need of 24 Hour Care.
Rept. no. 9,
1980, 75p

This report is concerned with the provision of design guidelines for accommodation for the relatively small number of very heavily dependent, younger physically disabled persons who, over long periods, require access to nursing care throughout the 24 hours of each day. They fall into a wide range of ages, the majority being between 13 years to 60 years of age with a tendency to cluster about 30 years of age. The common factor is very heavy physical dependence. The provision of hostel and 'family home' accommodation without night staff for those who are not so heavily dependent is a separate issue which is not considered in this report.

Pub. in Clinical Experimental Pharmacology and Physiology, v7 p383-389 1980.

A model system of the thermal dilution technique was used to determine in vitro the loss of thermal indicator across different sizes of polyethylene catheters. Thermal indicator loss (caloric gain by the indicator fluid or caloric loss by the catheter) per unit length of catheters increased as a function of the outer radius of the catheters. This study indicates that there is a measurable loss of thermal indicator during injection corresponding to a loss of between 9 and 16% (for a 11.5 cm length of PE 50 and PE 240) of the required calories for warming the injectate to 37C. Data is provided for correction of heat loss across the wall of a given length and diameter of polyethylene tubing.

Prospective Study of Post Transfusion Hepatitis (Transfusion-transmitted Viruses Study),
James W. Mosley, Richard D. Aach, Gary L. Gitnick, F. Blaine Hollinger, and Wolf Szmuness.
30 Jun 81, 41p
Contract NO1-HB-4-2972
Prepared in cooperation with Washington University, St. Louis, MO., University of California, Los Angeles, CA., Baylor College of Medicine, Houston, TX, and New York Blood Center, New York.

To complete the analysis of major factors potentially influencing risk of non-A, non-B viral hepatitis, recipient characteristics were analyzed. Sex, age, prior transfusion, prior hepatitis B experience, and number of transfusions administered had no influence. The last finding seems explained by protective interaction among multiple units. In stepwise regression, only donor characteristics emerged as important. A donor characteristic not previously analyzed was subtype of hepatitis B virus strain among donors positive for antibody to hepatitis B surface antigen. The findings were negative except for a subgroup for whom age was more closely related to outcome.

Food Allergy and Hypersensitivity. January, 1973-July, 1981 (Citations from the Food Science and Technology Abstracts Data Base).
Rept. for Jan 73-Jul 81.
Jul 81, 100p
Supersedes PB80-803455.

The cited articles in this bibliography cover the basic knowledge and new developments in food allergy and hypersensitivity. Included are studies of allergy among food workers, and methods for handling this problem. The allergenic potential of foods, food additives, and food packaging materials and finishes, the mechanisms involved, clinical manifestations and diagnosis, and treatments for food allergies and related hypersensitivities, are discussed. Specific articles on dyslexia, or learning disability, migraine, hyperactivity, and inattentivity in children, stomach cramps, rashes, and other frequently mentioned ailments sometimes related to diet, are also included. Sources of potentially allergy- producing components in human diets, arising from animal feed or fertilizers, are mentioned. (This updated bibliography contains 111 citations, 38 of which are new entries to the previous edition.)

Striped Bass and the Management of Cooling Lakes.
C. C. Coutant. 1981, 12p
Contract W-7405-ENG-26
Conference on waste heat management and utilization, Miami, FL, USA, 12 May 1981.

Striped bass, Morone saxatilis, is being introduced to freshwater reservoirs, some of which are used for power plant cooling. The thermal niche of this fish species changes with age and greatly influences its success. Juveniles, which prefer and grow optimally near 24 to 26 exp 0 C (75-80 exp 0 F), may thrive in cooling lakes. However, adults, which seek temperatures near 20 exp 0 C (68 exp 0 F) and exhibit poor growth and survival above 22 exp 0 C (72 exp 0 F), may not survive summer conditions. Striped bass management in cooling lakes should be guided by these thermal requirements. (ERA citation 06:024362)

Assessment of Impacts from Water Level Fluctuations on Fish in the Hanford Reach, Columbia River.
C. D. Becker, D. H. Fickeisen, and J. C. Montgomery. May 81, 63p PNL-3813
Contract AC06-76RL01830
Microfiche only after original copies are exhausted.

Observations on the effects of water level fluctuations in the Hanford Reach of the Columbia River, Washington, were made in 1976 and 1977. The two years provided contrasting flow regimes: high water and fluctuations of greater magnitude prevailed in 1976; low water and higher temperatures prevailed in 1977. Situations where fish and other aquatic organisms were destroyed by changing water levels were observed and evaluated each year in three study areas: Hanford, F-Area, and White Bluffs sloughs. Losses primarily were due to stranding, entrapment (with or without complete dewatering), and predation. Juvenile fish were more susceptible to entrapment and stranding than were adult fish. Estimates of actual losses were biased and conservative because relatively few fish could be found after each decline of water level and dewatering. The most valued species of fish affected by water level fluctuations at Hanford were the anadromus fall chinook salmon (Oncorhynchus tshawytscha) and the resident smallmouth bass (Micropterus dolomieui). Crucial periods for chinook salmon occurred during winter when incubating eggs were in the gravel of the main channel, and before and during seaward migration in the spring when fry were abundant in shoreline zones. The crucial period for smallmouth bass was during spring and early summer when adults were spawning in warmed sloughs and shoreline zones. Chinook salmon and smallmouth bass fry were vulnerable to stranding and entrapment, and smallmouth bass nests were susceptible to exposure and temperature changes resulting from repeated water level fluctuations. Thus, flow manipulation may be crucial to their survival. The extent to which other species of riverine fish were affected by water level fluctuations depended upon their use of shoreline zones for spawning and rearing young. (ERA citation 06:023258)

Bacterial Analysis of Water and Sediment Samples.
A. J. Francis, H. L. Quinby, and G. R. Hendrey.
Mar 81, 20p BNL-51375
Contract AC02-76CH00016
Microfiche only after original copies are exhausted.

Water and sediment samples collected from the Monongahela River, WV, were analyzed for total bacteria by direct counts using epifluorescence microscopy and the lipopolysaccharide (LPS) content by the limulus amebocyte lysate assay. The population ranges of bacteria in water and sediment samples were 2.4 to 6.5 x 10 exp 6 /ml and 0.7 to 2 x 10 exp 10 /g dry weight, respectively. The bound LPS in water samples ranges from 3 to 17 ng/ml. Sediment samples contained 17 to 34 mu g of bound LPS/g dry weight of sediment. The relationship between bound LPS and bacterial cell number and the estimated bacterial carbon biomass by direct bacterial counts and LPS assay are discussed. The average ratios of the direct bacterial-count-derived carbon to the lipopolysaccharide-derived carbon for water and sediment samples were 1.03 +- 0.60 and 1.10 +- 0.53, respectively. (ERA citation 06:024207)

Vertebrate Behavior and Ecology. Progress Report, June 1, 1980-May 31, 1981.
J. R. Tester, and D. B. Siniff. Jun 81, 188p DOE/EV/01332-T1, COO-1332-132
Contract AC02-76EV01332
Microfiche only after original copies are exhausted.

This report details progress on two subprojects: 1. Engineering design and development and 2. Ecological aspects of sea otters, grouse and fish. Engineering design and development focused on the refinement and adaptation of existing technology. This included the design of two types of implantable transmitters, the development of a more efficient sonic tag, the development of a computer compatable data recorder, and the support of ongoing projects. This recorder is designed to take data of a general nature, record it on cassette tape, allow the user to examine the data in the field and then transfer it to any general purpose computer for data analysis. Field efforts presented under Subproject II resulted in further information on activity patterns, movements and feeding behavior of sea otters in Alaska. California sea otter activity patterns were found to be highly variable among individuals and within an individual over time. A catalogue of sea otter behavior was developed and analyzed. Spruce grouse exhibited strong seasonal habitat preferences; winter habitat preference consisted of jack pine uplands, whereas, during the summer most females preferred coniferous lowlands. Ruffed grouse varied considerably in habitat utilization patterns in north-central Minnesota, with trembling aspen used extensively during winter months. (ERA citation 06:024173)

Health and Environmental Effects of Synthetic Fuel Technologies: Research Priorities. Report to the Federal Interagency Committee on the Health and Environmental Effects of Energy Technologies.
R. D. Brown. Apr 81, 229p MTR-80W348
Contract AC01-79EV10018
Microfiche only after original copies are exhausted.

This report is an assessment of the health and environmental effects research priorities related to coal gasification and liquefaction and oil shale development. It reflects the subjective judgments of well chosen research scientists in relevant disciplines. These scientists reviewed the results of workshops conducted in 1978 on coal gasification and liquefaction and oil shale, background information on related federal research, and comments by relevant federal agencies. The scientists prepared a listing of current research needs according to major areas of concern. These were categorized as to generic, region-specific, or process specific research. For the latter category, various scales of development were addressed for two exemplary processes: SRC (solvent refined coal) II and above ground oil shale retorting. Subjective judgments were used to prioritize the research tasks and assess the adequacy of current research. (ERA citation 06:023056)

Du Pont de Nemours (E.I.) and Co., Aiken, SC. Savannah River Lab.
Interactive Effects of Temperature and Nutrients on Periphyton Assemblages from a Low-pH South Carolina Stream.
D. C. Brown. May 81, 178p
Contract AC09-76SR00001
Thesis. Submitted to Univ. of South Carolina, Columbia.

Periphyton that accumulated on glass slides in a flow-through, artificial stream system at the Thermal Effects Laboratory, Savannah River Laboratory, were studied for their response to continuously elevated temperatues and to nutrient additions. Although the stream water used in these experiments was low in nutrients, addition of nutrients rarely increased periphyton biomass or carbon-uptake rates. The most consistent stimulation occurred in July at 12 exp 0 C above ambient temperature. Large day-to-day variations in chlorophyll a and rate of carbon-uptake of the assemblages were observed at ambient temperatures and at elevated temperatures. Temperature and available carbon varied on approximately the same time scale as the algal parameters. It is concluded that nutrient imitation, if it exists in this system, is masked by the effects of temperature and, in summer, possibly by limitation of carbon to the periphyton. (ERA citation 06:024364)

Pesticides in the Environment: Their Behaviour, Distribution and Analysis,
I. Baunok. Apr 80, 54p CSIR-APRG/80/4

The term pesticide is applied to a wide range of chemicals of synthetic or natural origin and it includes insecticides, herbicides, fungicides, nema-

tocides, etc. Pesticides are employed to protect plants, animals and their products against destruction or competition by living organisms including insects, fungi, rodents, worms, plants, etc. Considering that food shortage is one of the main problems of mankind, there can be no doubt about the necessity of their use. The aims of this report are: To present the latest information on the toxicity, behaviour and distribution of pesticides in the environment; To review and discuss current analytical methods for the determination of pesticides in the atmosphere; To make suggestions for starting a research program on a study of the occurrence and behaviour of pesticides in the atmosphere of South Africa.

Hierarchical Set of Models for Estimating the Effects of Air Pollution on Vegetation.
J. R. Kercher, M. C. Axelrod, and G. E. Bingham.
26 May 81, 34p CONF-810488-1
Contract W-7405-ENG-48
International symposium on energy and ecological modelling, Louisville, KY, USA, 20 Apr 1981.

Three models have been developed to estimate the effects of air pollutants on vegetation at the photosynthetic process (PHOTO), plant (GROWI), and community (SILVA) levels of resolution. PHOTO simulates the enhancement of photosynthesis at low H sub 2 S levels, depression of photosynthesis at high H sub 2 S levels, and the threshold effects for sulfur pollutants. GROWI simulates the growth and development of a plant during a growing season. GROWI has been used to assess the effects on sugar beets of geothermal energy development in the Imperial Valley, California. SILVA is a community-level model simulating the effects of SO sub 2 on growth, species composition, and succession, for the mixed conifer forest types of the Sierra Nevada, California. (ERA citation 06:024120)

Navy Experimental Diving Unit, Panama City, FL.
United States Coast Guard Emergency Underwater Escape Rebreather Evaluation.
Final rept.,
C. G. Gray, E. O. Thalmann, and R. Syklawer.
Apr 81, 18p Rept no. NEDU-2-81

The United States Coast Guard (USCG) Emergency Underwater Escape Rebreather (UER) was evaluated at the Navy Experimental Diving Unit. Physiologic testing in the dry laboratory, monitoring breath-to-breath O2 and CO2 levels, delineated the factors used in selection of 40% O2 as an appropriate and safe breathing mixture. Tests during exercise provided the maximum usable duration in cold water to be 2 minutes. Pool studies evaluated the suitability for in-water use of the UER to a maximum working depth of 6 FSW. The results demonstrated the UER to be an acceptable shallow depth emergency escape device. The use of a nose clip or face mask is recommended to minimize gas loss and possible aspiration of water through the nose. Minor shortcomings in the breathing characteristics of the device may be improved by changes in the breathing bag configuration. (Author)

AD-A100 919/0 PC **A04**/MF **A01**
Army Natick Research and Development Command, MA. Food Engineering Lab.
Energy Rating of Food Service Equipment Used in Army Dining Facilities.
Technical rept.,
K. H. Hu, R. A. Lampi, and M. Meyers. Nov 79, 67p FEL-105, NATICK-TR-80/006

This report provides energy ratings (in terms of Btu consumption) of food service equipment that might be used in Army dining facilities. A Btu Rating List is attached to this report (Appendix) so that energy consumption of equipment can be readily compared. This report also furnishes a simple computation for calculating the costs of energy for operation. It also shows, in detail, how Btu ratings are calculated and their significance. It has been learned from calculations made on the Btu Rating List and from laboratory testing at NARADCOM that steam (whenever it can be used directly for heating) is the least expensive type of energy, gas is second, and electricity is the most expensive. The BTu ratings and costs of energy for operation that are provided in this report, together with other considerations, such as initial and maintenance costs, product acceptance, etc., can contribute to a more rational selection of equipment and systems. (Author)

Army Natick Research and Development Labs., MA.
USAF Food Habits Study. Part III. Weight Gain and Food Preferences of the Overweight.
Technical rept.,
Kerry W. Wyant, and Herbert L. Meiselman. Oct 79, 100p Rept no. NATICK/TR-79/043
See also Part 1, AD-A085 876.

Based upon self-reported descriptions and using the height-weight tables of the Metropolitan Life Insurance Company, a sample of Air Force enlisted personnel, broken down by race and sex, were classified as either overweight (OW), average weight (AW), or underweight (UW), and weights upon entrance into the service were compared with weights after entrance into the service. Further, food preferences were assessed. The majority of the male respondents were OW while the majority of female respondents were AW, and more females than males were concerned about their weight. Approximately 25% of the OW males became OW within the first 2 years of service, and OW respondents with a meal card tended to have gained more weight than OW respondents without a card. Meat items were among the high preference foods of the OW while fruits were among the high preference foods of the AW and UW. Seventeen of the foods for which significant preference differences were obtained were preferred more by the OW than the UW, and 13 of these were meat or entree items. Overweight females as well as OW males exhibited a greater preference than did the UW for meats and entrees. Overweight respondents also indicated a greater preference for low calorie soda. Other preference differences indicated that lighter weight respondents preferred fruits and desserts more than did the OW. Females were the most likely to report using dieting methods to lose weight. (Author)

Economics and Statistics Service, Washington, DC. National Economics Div.
Food Safety Policy: The Delaney Amendment.
Staff rept.,
Sara D. Short. Apr 81, 27p AGESS-810423

Increasing use of chemicals in all stages of food production has generated concern about possible harmful health effects of these chemicals. Federal regulation of foods has attempted to control exposure to some chemicals. Between 1950 and 1953, New York Congressman James Delaney conducted a series of hearings on the nature and use of chemicals added to the food supply. One resulting piece of the legislation was the Food Additives Amendment of 1958, of which the Delaney clause is a part. This clause prohibits use of any chemical found to induce cancer when ingested by animals or humans. This paper discusses current and previous issues concerning this controversial clause.

PB81-224362 PC **A09**/MF **A01**
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Protein Recovery From Beef Packing Effluent.
Final rept. 1977-81,
John C. Ward, Walter Adams, and H. Chr. Isaksen. Jun 81, 178p EPA/600/2-81/112
Grant EPA-S-804505
Prepared in cooperation with Sterling Colorado Beef Company, Sterling, CO. and Alwatech, Oslo, Norway.

The wastewater from a beef packing plant contained 4,600 mg/1 COD and 2,500 mg/1 of suspended solids. A physiochemical wastewater treatment process that recovers protein removed 80%

of the oxygen demand and suspended solids, and 94% of the fat, oil, and grease. Total cost was $3 per 1,000 gallons (44% capital costs). About 2 pounds of protein were recovered per head. A price of 42 cents per pound of protein would pay all costs. The discharge of BOD was reduced to less than 3 pounds per head. For every pound of BOD entering the wastewater treatment plant, 0.77 pounds of product was recovered with a composition of 38% protein, 11% grease and oil, 27% inorganic solids, and 24% other solids (dry weight basis). This wastewater treatment process can be used as a pretreatment process for beef packing effluent prior to discharge to a conventional sewage treatment plant. A literature survey covering 7 different beef packing wastewater treatment processes was developed from 87 papers and reports. The cost figures given above were observed in a full scale plant and should not change significantly with different size wastewater treatment plants.

National Technical Information Service, Springfield, VA.
Mycotoxin Carcinogenicity in Food. January, 1972-July, 1981 (Citations from the Food Science and Technology Abstracts Data Base).
Rept. for Jan 72-Jul 81.
Jul 81, 61p
Supersedes PB80-803422.

The reports deal with the occurance and bioproduction of mycotoxins and aflatoxins in foods, tolerance levels, newly discovered mycotoxins and aflatoxins, toxicity, modes of action, metabolism, and public health aspects. Experiments appearing to prove a link to hepatic cell cancer in rats, and the implied link to such cancer in humans, are delineated. The mutagenic and carcinogenic effects in animals and in humans are discussed, including DNA alteration, chromosomal aberrations, cell transformations, cytological investigations, and in-vitro and in-vivo reactions with nucleac acids. Much of the source of mycotoxins in food destined for human consumption can be traced to two fungi: aspergillus and penicillum. These appear in foods such as rice grains, cereal grains, rice and wheat flour, soybeans, red beans, and other legumes, some fermented foods, some pickled foods, dried fish, and edible seaweeds. (This updated bibliography contains 52 citations, 11 of which are new entries to the previous edition.)

Self-Evaluation Instrument--Nitrogen Fertilizer Industry.
Frank W. Godbey, Loren L. Hatch, James D. Massie, Arthur N. Gentry, and George Mueller.
Sep 80, 167p DHHS/PUB/NIOSH-80-148

A questionnaire is developed to allow self evaluation of exposure hazards by workers in the nitrogen fertilizer industry (SIC-2873). The questionnaire is directed toward operations, work practices, proper procedures, and regulations within the industry, and provides guidelines for the implementation of hygienic measures. Each section of the questionnaire is preceded by a brief explanation of the occupational safety and health hazards that may exist in the particular work area covered by that section. The authors recommend that companion documents, self-evaluation of Occpational Safety and Health Programs, which provide basic information applicable to all industries, be used in conjunction with the questionnaire to aid in the implementation of a comprehensive occupational safety and health program.

SRI International, Menlo Park, CA.
Industrial Hygiene Surveys of Occupational Exposures to Mineral Wool.
Technical rept.,
Douglas P. Fowler. Sep 80, 203p DHHS/PUB/NIOSH-80-135
Contract PHS-NIOSH-210-76-0120

Exposures to mineral wool fibers, total suspended particulate material, respirable particulate material, and trace metals were evaluated among users and producers of mineral wool. Study methods included breathing zone air sampling with gravimetric, optical and scanning electron microscopy, and atomic absorption analyses to determine airborne concentrations. Samples of bulk materials were also analyzed. The production workers had relatively low exposures to all forms of airborne particulate material. The user workers had higher, but more variable exposures. Exposure to excessive noise levels were consistently found in the cupola areas of the production facilities. Heat stress was a potential hazard for the installers of blown mineral wool insulation. The author recommends that exposures to blowing wool installers and cupola operators be further evaluated, personal respiratory protection be provided for sprayed fireproofing workers, engineering measures be developed to improve the working conditions of the blowing wool insulation workers, and older material samples be analyzed to identify potential past exposure to small diameter fibers.

A Symposium on the Diagnosis and Amelioration of Mass Psychongenic Illness in Industry.
Contract rept.,
Michael J. Colligan. 1979, 387p NIOSH-210-79-0033

Proceedings from a symposium on the diagnosis and amelioration of industry related mass psychogenic illness (MPI) is presented. Outbreaks of unusual behaviors, sickness and hysteria in manufacturing and assembly facilities and workplaces in the United States, and other countries including England and Singapore are reviewed. Outbreaks of MPI investigated by NIOSH also are included. Social comparisons, complexities, cautions and concepts in research on MPI are discussed. Stress, illness related behaviors, somatization, triggering events, theoretic and psychoanalytic approaches to the study of MPI are described with reference to concepts of convergence, contagion, emergent norms, core variable, sex difference, and coping with stress. Factors that affected symptoms including hysterical contagion, quality of the working environment, mechanization, automation, shift work, extra-large enterprises, anonymity of the workers. Workers and management relations are discussed. The effect of MPI on rapid industrialization in developing countries in described and MPI and chemically induced hypersusceptibility are compared.

Recirculation of Industrial Exhaust Air Pilot Study (Field Evaluation of Air Cleaners and Monitors).
Contract rept.,
Mark L. Holcomb, and Robert C. Scholz. May 80, 200p NIOSH-210-78-0011
Contract PHS-NIOSH-210-78-0011

Performance characteristics, maintenance requirements and reliability of pilot scale air cleaners and monitors were evaluated. A set of evaluation criteria was developed for recirculation components. System components which included an aspirated cartridge filter, particulate air monitors, ozone monitors and a safety monitoring filter were tested on industrial welding exhausts to evaluate performance, potential failure, and requirements of proper maintenance. The authors conclude that the criteria can be applied to any recirculation system. They recommend that the technical and economic feasibility of recirculation be assessed by pilot testing procedures, and a mobile recirculation system incorporating pilot scale devices to conduct pilot scale testing be used.

Health Effects Evaluation Data File.
Technical rept.,
Virginia Behrens, Edward Dacey, Roop Jain, Foster Burns, and Pradeep Trasi. Oct 80, 87p
Prepared in cooperation with Cincinnati Univ., OH.

The design of the Health Effects Evaluation Data (HEED) File and the methods used to abstract, code, and computerize Health Hazard Evaluation (HHE) and Technical Assistance (TA) data are described. The following data item categories were included in the final data base design: general report information; hazards; occupations; environmental samples; morbidity and mortality; and laboratory and medical tests. HHE and TA reports are prepared for entry into the data base by personnel trained in chemistry. Computerization of the basic file for the data base is managed by a computer programmer. The data from HHE/TA reports is coded numerically in the HEED File so that analyses such as hierarchical aggregations, frequency counts, cross tabulations, and selection of quantitative levels of categories can be performed. Examples of computer printouts from HHE and TA report are provided along with a listing of potential HEED File users.

Occupational Safety and Health Hazards in Rehabilitation Facilities.
Sep 80, 41p DHEW/PUB/NIOSH-80/147

Occupational safety and health hazards in rehabilitation facilities are discussed. Hazards associated with fire, machine guarding, electrical equipment, housekeeping, material handling, and walkways and exists, and exposures to chemical and physical agents are reviewed. Hazard control methods involving engineering and administrative controls, and personal protection measures are outlined. Hazards due to poorly trained staff and outmoded equipment are considered. Routes of exposure for hazardous substances are listed along with work operations that commonly involve chemical exposure. The effects of the physical and mental condition of the exposed individual on hazard responses are discussed. Safety and health assistance services provided by federal and state governments and by private consulting firms are discussed.

Digital Control System for An On-Borad Oxygen Generator.
Master's thesis,
Thomas C. Horch. Dec 80, 88p Rept no. AFIT/GEO/EE/80D-2

A prototype on-board oxygen generation system (OBOGS) is being tested by the USAF School of Aerospace Medicine (SAM). The OBOGS is a candidate to replace present liquid oxygen systems for aircrew consumption on manned aircraft. The OBOGS passes outside air through a molecular sieve to produce an oxygen enriched breathing product. Oxygen concentration of the OBOGS's output is controlled by a purge orifice valve. The SAM envisions using a digital system to control the OBOGS. A digital contro system for the OBOGS was developed and consists of a stepper motor, microprocessor, system sensor, support circuitry, and software. The control system software is a collection of instructions which allow the MPU to read data from sensors, to interpret that data, and to issue system hardware control signals. System software was fairly complex as methods were employed to compensate for the OBOGS's lengthy response time. This was accomplished by using a segmented table. If motor drive is anticipated to be time-consuming, a software routine is used to preposition the motor to a predetermined location within the segmented table. This position is updated when more accurate information is available. A prototype system was constructed and tested in the laboratory. The control system successfully controlled the stepper motor. Anastigmatic High Magnification, Wide-Angle Binocular Indirect Attachment for Laser Photocoagulator.
Patent Application,
Oleg Pomerantzeff. Filed 27 Feb 81, 15p PB81-222549
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The patent application relates to photocoagulation of the human eye and, more particularly, to improved methods and apparatus for laser photocoagulation.

PAT-APPL-6-239 448 PC **A02**/MF **A01**
Department of Health and Human Services, Washington, DC.
Macula-Disc Camera with Improved Resolution.
Patent Application,
Oleg Pomerantzeff. Filed 2 Mar 81, 13p PB81-222556
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The patent application relates to ophthalmoscopic cameras in general and, more particularly, to a macula-disc camera having improved resolution. In order to increase the resolution of retinal detail in fundus cameras it is necessary to increase the magnification and thereby clarify microscopic details. In the prior art, greater magnification has been realized only by increasing the magnification of the recording camera, thereby magnifying one part of the intermediate aerial image without changing the objective (i.e. ophthalmoscopic lens) of the fundus camera.

PAT-APPL-6-262 153 PC **A02**/MF **A01**
Department of the Navy, Washington, DC.
Helmet Mounted Eye Tracker Using a Position Sensing Detector.
Patent Application,
Denis R. Breglia. Filed 11 May 81, 12p AD-D008 545/6
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A helmet mounted eye tracker is disclosed for monitoring the position of the cornea of human eye which includes an infrared light source for projecting a pulsed infrared light beam along a first optical path, a mirror for redirecting the pulsed infrared light beam along a second optical path, and a beam splitter for redirecting the pulsed infrared light beam onto the cornea of the eye such that within the eye a virtual image is formed which changes position with movement of the cornea of the eye. The virtual image formed within the eye is then redirected along the second optical path by the beam splitter to the mirror which, in turn, redirects the virtual image to a collecting lens positioned along the first optical path. The collecting lens will then focus the virtual image upon the active area of an infrared light detector which will provide at its output square wave signals indicative of the X and Y coordinate positions of the cornea of the eye within the active area of the infrared light detector. (Author)

PATENT-4 244 787 Not available NTIS
Department of Health, Education, and Welfare, Washington, DC.
Apparatus and Method for Determining Serum Concentrates of Metabolites by Monitoring Dialysate Fluid.
Patent,
Elias Klein, and Ronald L. Wathen. Filed 11 Jun 79, patented 13 Jan 81, 8p PB81-218943, PAT-APPL-6-047 786
Supersedes PB81-152738.
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 $0.50.

An apparatus and method are disclosed for monitoring, analyzing and quantitating in real time the concentrations of metabolites in serum by analyzing the dialysate solutions which are being equilibrated with the blood via a hemodialyzer. Thus, access to certain metabolically important species is provided without the necessity of blood sampling. The apparatus includes at least one ion-selective electrode coupled with the dialysate effluent stream, and the electrode EMF is converted to dialysate concentrations based on precalibration. The dialysate concentrations, in turn, are related to serum levels by factors governing mass transfer through the dialyzer.

Library of Congress catalog card no. 80-600161.
See also PB80-216864.

The diffusion of biomedical technology in the United States has had a striking impact on health care personnel, institutions, and costs. The rate at which biomedical innovations are diffused within the health care system, although an important characteristic of that system, is also one about which relatively little is known. The diffusion of some innovations (e.g., certain anticancer drugs) is allegedly too slow, while the diffusion of others (e.g., coronary bypass surgery and total body scanners) is allegedly too rapid. The authors have little knowledge about determining how and why technological innovations actually diffuse and little experience in specifying socially optimal rates of diffusion for various types of innovations. Focusing on one new technology--bone marrow transplantation (BMT)--this study presents both a critical analysis of the technology itself and policy options that would strengthen control over the rate of technological diffusion.

The Implications of Cost-Effectiveness Analysis of Medical Technology. Background Paper No. 2: Case Studies of Medical Technologies. Case Study No. 7: Allocating Costs and Benefits in Disease Prevention Programs: An Application to Cervical Cancer Screening,
Bryan R. Luce. Jun 81, 43p OTA-BP-H-9(7)
Library of Congress catalog card no. 80-600161.
See also PB80-216864.

This study is an attempt to advance the state of the art of cost-effectiveness analysis (CEA) as the technique pertains to disease prevention and health promotion programs. Cervical cancer screening is used as the subject of analysis to demonstrate the application of CEA to a disease prevention program. First, the disease process is modeled using a Markov chain technique to 'age' a simulated population of 30- to 39-year-old women for 10 years, using disease transition probabilities reported in the literature. Then, the cost effectiveness of screening at different intervals, ranging from no screening to annual screening for the 10-year period, is calculated. The effects of the following are evaluated: (1) different migration patterns, (2) different risk groups, (3) different modes of administering Pap tests, and (4) joint production considerations. The sensitivity of the results both to various discount rates and to a range of Pap test error rates are also tested.

The Implications of Cost-Effectiveness Analysis of Medical Technology. Background Paper No. 2: Case Studies of Medical Technologies. Case Study No. 8: The Cost Effectiveness of Upper Gastrointestinal Endoscopy,
Jonathan A. Showstack, and Steven A. Schroeder. May 81, 33p OTA-BP-H-9(8)
Library of Congress catalog card no. 80-600161.
See also PB80-216864.

Upper gastrointestinal endoscopy is only one of many relatively new diagnostic and therapeutic technologies that are in widespread use in the medical care system. Examples of others are coronary angiograms, renal hemodialysis, and fetal monitoring. Few new technologies are evaluated thoroughly before they become part of 'standard

practice.' Evaluating their worth and attempting to make their use as efficacious as possible, therefore, presents many formidable problems. This report presents analysis of the cost and efficacy of the current use of upper gastrointestinal endoscopy. However, the analyses and conclusions reached have parallels in many other medical technologies already in current use in a wide variety of medical specialties in many different settings.

Staunton 1 Reclamation Demonstration Project. Soil Microbial Structure and Function: Final Report.
R. M. Miller, and S. W. May. Feb 81, 30p
Contract W-31-109-ENG-38

At the Staunton 1 reclamation demonstration project in southwestern Illinois, comparisons were made of microbial decomposition rates, respiration, and microbial numbers in several coal refuse reclamation treatments. After 1.5 years, none of the reclamation treatment plots equalled the old-field control plot in decomposition rates or microbial resiration. Microbial numbers in the reclamation plots, however, approached those of the old field, although species diversity in the old field was much higher than that in the reclamation plots. The Effect of Long-Term Therapeutics, Prophylaxis and Screening Techniques on Aircrew Medical Standards.
Conference proceedings,
C. E. Simpson. Mar 81, 149p Rept no. AGARD-CP-310
Presented at the Aerospace Medical Panel Specialists' Meeting, Toronto (Canada), 15-19 Sep 80.

The introduction of advanced aircraft has placed a much increased stress on aircrew who are subjected to the high physical stress loads of sustained high 'g' manoeuvres, vibration, high noise levels and heat stress. Crews are required to produce a constant high degree of concentration with little or no margin for error. Is an increased degree of aircrew fitness necessary. Is there a need for special selection of the crews to fly these aircraft. The diagnosis of certain diseases has, to date, resulted in the concerned aircrew being declared permanently unfit to fly. Modern methods of treatment, however, have now made it possible to consider the return of these aircrew to flying duties. Under what conditions may aircrew with diseases which require long-term therapy continue to fly and what limitations must be applied in such cases. The papers presented at the Aerospace Medical Panel Specialists' Meeting in Toronto, Canada, 15-19 September 1980 address these questions. (Author)

Comparative Anthropometry of the Hand.
Technical rept.,
Robert M. White. Dec 80, 185p NATICK/CEMEL-229, NATICK-TR-81/010

Comparative anthropometric data on the human hand are presented and discussed in detail in this technical report. Since reliable and definitive data on the hands of the U.S. civilian population are lacking, anthropometric data on the hands of the U.S. military population of men and women may be utilized in analyses of handwear sizing. Data are presented for ten hand measurements: Hand Length, Palm Length, Thumb Crotch Length, Hand Breadth, Hand Breadth at Thumb, Hand Circumference, Hand Circumference at Thumb, Fist Circumference, Wrist Circumference, and Hand Thickness. These hand measurements are defined and illustrated. Detailed anthropometric data on the hands of U.S. Army men and women are presented in the form of bivariate tables which depict the distribution of various categories of hand sizes, and show the interrelationships among hand dimensions. Selected anthropometric data on the hands also are presented for a variety of foreign military populations in order to illustrate the range of variation in hand size to be found in different parts of the world. In the final section, hands and handwear are examined in terms of the sizing of handwear, and the development of tariffs for handwear is explained with illustrative examples. An extensive bibliography concludes the report. (Author)

Visual Acuity Testing of Radiographic Inspectors in Nondestructive Inspection.
Final rept.,
Gary T. Yonemura. Jun 81, 32p NBS-TN-1143

Visual acuity tests for radiographic inspectors should be correlated with the type of tasks encountered in real world radiography. The testing procedures should be capable of assessing differences in day to day performance of a given inspector as well as the performance of one inspector relative to other inspectors. Single line targets with specific parametric values for contrast, width, and blur are recommended to provide a means for testing a radiographic inspector for visual acuity. These targets may be used for periodic tests by the employing organization or for more frequent self testing by the inspector. Statistics from the National Health Survey, procedures recommended by the NAS-NRC Committee on Vision and real world radiographs have been utilized in arriving at recommended test configurations.

Site of Action of Antidiuretic Hormone on Mammalian Nephrons.
Final rept.,
David mailman. 1981, 28p
Contract N00014-75-C-0166

There are two basic mechanisms by which salt, water and small organic solutes cross epithelial tissues, such as the gut and kidney, from the lumen into the blood. One mechanism is by transcellular transport across the luminal mucosal or apical cell membrane and then through the basolateral or serosal cell membrane. Solutes are transported by membrane carrier molecule pumps which transport the solutes by facilitated or active transport. A second mechanism by which many of the same solutes cross the membrane is through passive, paracellular movement through the tight junctions and the lateral intercellular spaces between the epithelial cells. Peptide hormones can directly affect transcellular movement by binding to the cell membranes at receptor sites and modulating intracellular events which increase or decrease pump activity. These same hormones could have cardiovascular effects which modify transcellular pumping by altering the delivery of O2 to the cells for support of transport energy requirements. Passive, paracellular transport can be altered by hormones acting through cardiovascular effects by changing blood flow and thus the degree of 'washout' of absorbed molecules from the epithelium and by changing capillary and tissue pressures resulting in a change in the magnitude of ultrafiltration across the capillaries and epithelium. The research supported by this grant investigated several aspects of the above mechanisms.

Grant DAMD17-80-G-9474

Excreted Factor (EF) is a carbohydrate-rich material released by different strains of Leishmania during growth. It has antigenic properties similar to those of the intact parasite and plays a role in the infective process. Isolation and purification of EF is necessary for study of its biological function, its use for diagnostic purposes, its use in immunization experiments, the study of its biosynthesis, and the preparation of inhibitors of particular biosynthetic steps. Purification of EF by affinity chromatography was markedly improved by introducing Ricinus lectin (specific for galactose) column. This enabled us to obtain more reliable amino acid and sugar analysis and will be instrumental in more advanced physical, chemical, and immunological studies. We have developed a radioimmunoassay for leishmaniasis utilizing purified EF. The assay can distinguish between Leishmania strains and once further developed, should prove most valuable for the diagnosis of the disease. EF plays a role in the infective process of Leishmania. We have now shown that surface carbohydrate, related to EF, plays a role in the initial attachment of Leishmania promastigots to macrophages - a stage that is a prelude to their engulfment by the macrophages followed by multiplication in their cells. Preliminary Study on Antiradiation Effect of Lingzhi.
Zhibin Lin, Zhiling Zhang, Huiren Liu, Yucheng Wu, and Yuan Ruan. 24 Jan 79, 2p
Included in Kexue Tongbao, v25 n2 p178-179 Feb 80.

As radiation injury is both disastrous to human health and on the increase today, the quest for antiradiative drugs is of ever greater significance. Previous reports have shown that, preparations of Lingzhi (Ganoderma lucidum) are effective for the treatment of leukopenia induced by radiation, by chemical products, or by some other factors, which implies that such a drug might be helpful to the prevention of radiation injury. Thus the authors made a study on the antiradiation effect of Lingzhi solution karst; for the method of extraction.

Pharmacokinetic Studies in Chronic Renal Disease and Hemodialysis.
Final rept. 19 Dec 78-18 Dec 80,
R. E. Cutler, A. D. Blair, E. D. Burgess, and K. H. Krichman. 18 Apr 81, 29p AK-5-2-2219-F
Contract N01-AM-2-2219
Prepared in cooperation with Harborview Medical Center, Seattle, WA.

Modifications of reported high performance liquid chromatographic assays for cimetidine and disopyramide have been developed. Renal clearance of creatinine and inulin were measured in 6 healthy subjects before and after a single intravenous bolus of cimetidine (5 mg/kg). Renal clearance of inulin was unchanged but renal clearance of creatinine decreased 20% following cimetidine. This is the first cationic drug to show substantial inhibition of tubular secretion of creatinine in humans. Disopyramide pharmacokinetics were studied in 5 normal and 5 end-stage renal failure subjects treated with intermittent hemodialysis following a single oral dose of 200 mg. There were no significant differences in the following parameters: plasma half-life and elimination rate constant. The relative steady state volume of distribution was significantly decreased in the end-stage renal disease (ESRD) subjects (1.04 plus or minus 0.35, normals; 0.60 plus or minus 0.18 L/kg ESRD, $p = 0.037$). Plasma clearance of disopyramide was significantly reduced in the hemodialysis subjects (66.4 plus or minus 25.3 vs. 30.0 plus or minus 6.6 ml/min/sq.m, $p = 0.026$). There was an increase in the protein binding of disopyramide with decreasing plasma concentration. The normal dose of 150-200 mg every 6 hours needs to be reduced in ESRD patients to 100 mg every 12 hours.

The Evaluability Assessment of the Developing Experiment in Post-Marketing Surveillance of Prescription Drugs,
Sumner Claren, Paul Nalley, Gail Gregory, Warren Frederick, and Renee Hausmann. Mar 81, 214p NBS-GCR-ETIP-81-96
Contract NBS-78-3603

The report describes the context within which a regulatory administrative experiment is being developed by the Experimental Technology Incentives Program (ETIP) and the Food and Drug Administration (FDA). The purpose of the experiment is to determine the impact on drug development approval of new methods of gathering and analyzing data after a drug is marketed. The report assesses the evaluability of the experiment, raising measurement considerations and proposing means for evaluation.

Cosmetic-Related Injuries: Study of NEISS Data: 1 Jan 79 to 31 Dec 31.
Final rept.,
Charles L. Selander. 31 Dec 79, 75p FDA/BMD-81/84
See also PB-290 973.

The study is based on 739 cosmetic-related injury cases reported to the National Electronic Injury Surveillance System (NEISS) between January 1, 1979, and December 31, 1979. Considering this number, NEISS estimates that 30,965 cosmetic-related injuries (a low estimate of 22,468 to a high estimate of 39,462 with a 95 percent certainty) were treated in hospital emergency rooms throughout the United States and its territories.

Aircrew Inflight Physiological Data Acquisition System.
Master's thesis,
Kenneth L. Moore. Jun 80, 126p Rept no. AFIT/GE/EE/80-6

A design is presented for a self-contained, man-mounted data acquisition system to sample and store 12 environmental and physiological parameters. The design consists of one-megabyte of nonvolatile magnetic bubble memory storage, 16 analog input channels, and four digital input channels, and is controlled by a 6502 microcomputer. Operational software was designed and simulation conducted on a Rockwell System-65 minicomputer augmented with two-megabits of magnetic bubble memory. Two types of data storage methods are examined - continuous (or pulse code modulation), and three variations of delta pulse code modulation for reduction of data storage. Nonuniform sampling rates (or sampling jitter) caused by simultaneous sampling requests were investigated, and ways to reduce or eliminate the occurrence of jitter are also presented. (Author)

Feedback Control for Functional Electrical Stimulation of Paralyzed Muscle.
Master's thesis,
Cory D. Carroll. Dec 80, 104p Rept no. AFIT/GE/EE/80D-11

An external harness containing six transducers was developed to provide position information from a cat's rear limbs. The front limbs rest in a sling apparatus while the rear legs are allowed to move in a straight line gait on a motorized treadmill. The aluminum members of the leg harness are noninvasively attached to the skeletal framework of the rear legs. The harness allows a relatively nonrestrictive forward and backward motion while limiting lateral movement of the leg. With the cat in the full harness system, the need for posture control during locomotion is eliminated because of the support system of the harness. During locomotion in the harness, electromyographic (EMG) activity of the essential hindlimb muscles were recorded with the corresponding position information from the harness. This data along with anatomical models of the leg allowed isolation of six essential muscles: iliopsoas, semimembranosus, vastus lateralis, biceps femoris, tibialis anterior, and gastrocnemius. Using only these six muscles, locomotion can theoretically be achieved while the cat is in the harness system. From the EMG data, initial activity of the essential muscles during locomotion was obtained and plotted against the cat step cycle. (Author)

A Computer Model of Saccadic Suppression.
Final rept.,
William J. Ohley. Jan 81, 47p AFOSR-TR-81-0477
Grant AFOSR-80-0112

This work provides a quantitative model of saccadic suppression in which the suppression of vision is shown to result from direct interaction of the spatial and temporal properties of the human visual system. The model can be divided into a spatio-temporal impulse response function, and a psychophysical detection process. The space-time impulse response function is derived from the retinal line spread function and know temporal response characteristics of humans. By assuming linearity, the saccade like motion of a slit of light passing over the relina is convolved in two dimensions with the space-time function. Inclusion of a single threshold decision rule then allows excellent prediction of experimental results. (Author)

Circuit for Calculating the Position of the Eye.
Patent Application,
Albert H. Marshall, and Gary M. Bond. Filed 11 May 81, 21p AD-D008 547/2
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

An eye position measurement circuit is disclosed for calculating the position of the cornea of the human eye. The eye position measurement circuit includes a dual axis infrared light detector which will sense the position of the cornea of the eye upon receiving pulsed infrared light reflected from the cornea of the eye. The dual axis infrared light detector is, in turn, connected in unique combination with filters, absolute value circuits, analog-to-digital converters, latches, a digital computer, and other electronic components for calculating the position of the cornea of the human eye. Zhengyu Qin. 25 Jul 78, 7p
Included in Kexue Tongbao, v25 n9 p790-796 Sep 80.

Experimental animal models for the study of obesity are of great significance to both endocrinological physiology and accelerating feeding domestic animals. The appetite regulating center has been shown in experimental animals to be bilateral and centered in the hypothalamus. It is often called the 'appestat'. Damage to the hypothalamus immediately creates a voracious appetic. It has been reported that there are separate centers for hunger (lateral and medial). The problem to work out a simple, safe and effective method so as to damage the ventromedial hypothalamus and to make an hypothalamic obesity model. Gold thioglucose (GTG) was used to damage glucose-sensitive tissue in the ventro-medial hypothalamus (VMH).

Physiological Design Goals for Thermal Protection of Divers.
Interim rept.,
Paul Webb. Sep 80, 10p
Contract N00014-80-C-0193

The predecessor of this document was a report entitled 'PROPOSED THERMAL LIMITS FOR DIVERS: A Guide for Designers of Thermally Protective Equipment,' which was written in July 1976 and circulated informally. Since that date there has been considerable progress in physiological research and increased interest in diver thermal protection. Therefore, under the auspices of the Naval

Medical Research and Development Command, a conference was arranged to consider revisions of the original document. The purpose of the guidance provided is to set goals for the design of equipment. It is not intended as an acceptance standard or military specification. The design goals represent compromises between medical conservatism and freedom for the designer. They should be revised as new evidence becomes available. (Author)

Upper and Lower Arm Load Simulator.
Patent Application,
Gerald J. Kron. Filed 18 Mar 81, 18p AD-D008 533/2
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The invention is concerned with providing an upper and lower arm load simulator wherein the lower arm torque is produced by a pancake torque motor embedded within a flight suit modified with additional zippers to permit ease of installation. The torque motor transmits torque to the arms via an arrangement of plastic stays and struts sewn between cloth layers of the flight suit. Upper arm loading is produced by a torque motor driven tether line embedded within the flight suit slightly above the waistline. This unit serves to create shoulder torque, load the upper arm,. and retard forward movement of the elbow. Accordingly, it is an object of the invention to provide an upper and lower arm load simulator wherein the lower arm load is applied by a pancake motor embedded in the flight suit near the elbow and the torque is transmitted to the arm by means of a series of plastic stays and struts sewn between cloth layers of the flight suit.

Evaluation of Respiratory Protection in Coal Preparation Plants.
Contract rept. (Final).
Jul 80, 115p NIOSH-210-78-0085
Contract PHS-NIOSH-210-78-0085

Surface coal mine (SIC-1211) and preparation facility operations were studied to determine respirable dust and vapor hazards and the effectiveness of respiratory protective equipment. Eight coal preparation facilities were surveyed. Dust samples were taken at strip mining, raw coal processing, coal preparation and coal loading operations, and at quality control laboratories. Area and personal air samples and area samples of methyl isobutyl carbinol (108112) (MIBC) were collected and quantitative respirator fit tests were performed. Concentrations of respirable coal dust in excess of Mining Safety and Health Administration's (MSHA's) permissible exposure limits (PEL) were found only in one coal loader at one facility. Respirable dust concentrations ranged from 0.01 to 2.73 milligrams per cubic meter (mg/cu m). The highest concentrations were measured on workers performing surface mine and coal loading activities. Only 1 out of 80 personal samples was greater than 2mg/cu m. Out of 51 area samples of respirable coal dust, 15 exceeded the MSHA PEL. Only 72 percent of the workers tested used acceptable respiratory protection. The occurrence of facial hair was significant in the workers who did not obtain satisfactory protection. The authors recommend that engineering controls be implemented to reduce dust concentrations, and a respiratory protection program be implemented.

Assessment of Mutagenic Activity in Thermally Processed, Frozen, Electron-Irradiated, and Gamma-Irradiated Beef Using the Ames Salmonella/Mammalian Microsome Mutagenicity Assay.
Final rept. Jun 78-Apr 80,
Linda S. Guthertz, and John T. Fruin. Jun 81, 121p Rept no. LAIR-70

Studies were undertaken to determine the mutagenic activity of beef that had been thermally processed, frozen, electron-irradiated, and gamma-irradiated. The Ames Salmonella/mammalian microsome mutagenicity assay, with several modifications, was used. Considerable difficulties in performing the test and interpreting the results were encountered. Experiments conducted showed that on some occasions up to 80% of the apparent revertants were not true revertants. The meats contained water-soluble growth factors, particularly histidine, which apparently supported greater than normal growth and macrocolony formation. Subsequently, the level of histidine in the media was reduced by an amount equal to that contributed by the meats. Also, extracts of the meat were substituted for whole meats as test material for evaluation. Particulate matter from the whole meats made automated colony counting impossible and complicated manual counting. Data collected failed to demonstrate that any of the meats or processing techniques produced mutagens. It was concluded that the test had limited applicability to whole food items and that the use of thermally, frozen, electron-irradiated, and gamma-irradiated processing does not induce mutagenic potential in beef. Microwaves and Human Leukocyte Function.
Final technical rept. Jan 80-Feb 81,
Norbert J. Roberts, Jr., Shin-Tsu Lu, and Sol M. michaelson. 19 Feb 81, 31p AFOSR-TR-81-0537
Grant AFOSR-80-0111

The objective of these studies is to determine whether exposure to microwaves (2450 MHz) affects the function of human leukocytes in the resting state and during antigenic or mitogenic challenge. This paper is a summary report of the construction and calibration of a waveguide exposure system for the exposure of human mononuclear leukocytes to 2450 MHz (CM) microwave energy. A description of the dual vial waveguide exposure facility for in vitro irradication of human leukocytes is presented. Calorimetric determinations of specific absorption rates (SAR) were made using heating curves measured with a microwave transparent Vitek 101 Electrothermia Monitor. The correlation between SAR and forward power was highly significant ($r = 0.95$). At a forward power of 0.55 W the averaged SAR was approximately 33 mW/m1. However, inhomogeneity and significant resonance absorption were noted in the dual vial waveguide exposure facility. A 30-point measurement of SAR distribution revealed that the SAR at any of the measured points could range between 0.12- and 3.94-fold of the average SAR within the given vial. Measurements indicated that this variability in SAR values did not create significant thermal gradients within the vials when external agitation was applied. (Author)

Nuclear Accident Dosimetry: Los Alamos Measurements at the Seventeenth Nuclear Accident Dosimetry Intercomparison Study at the Oak Ridge National Lab., DOSAR Facility, August 1980.
D. G. Vasilik, and R. W. Martin. Apr 81, 20p
Contract W-7405-ENG-36

Teams from various US and foreign organizations participated in the Seventeenth Nuclear Accident Dosimetry Study held at the Oak Ridge National Laboratory's (ORNL) Dosimetry Applications Research (DOSAR) facility August 11 to 15, 1980. Criticality dosimeters were simultaneously exposed to pulses of mixed neutron and gamma radiation from the Health Physics Research Reactor (HPRR). This report summarizes the experimental work conducted by the Los Alamos team. In-air and phantom measurements were conducted by the Los Alamos team using area and personnel dosimeters. Combined blood sodium and sulfur fluence measurements of absorbed dose were also made. In addition, indium foils placed on phantoms were evaluated for the purpose of screening personnel for radiation exposure. All measurements were conducted for unshielded, 5-cm steel and 20-cm concrete shielding configurations. All participant dosimeters were exposed at 3 m from the center of the HPRR core. PREREM: An Interactive Data Preprocessing Code for INREM II. Part I: User's Manual. Part II: Code Structure.
Technical rept.,
M. T. Ryan, and D. E. Fields. May 81, 73p
ORNL/NUREG/TM-422
Contract W-7405-eng-26

PREREM is an interactive computer code developed as a data preprocessor for the INREM-II internal dose program. PREREM is intended to provide easy access to current and self-consistent nuclear decay and radionuclide-specific metabolic data sets. Provision is made for revision of metabolic data, and the code is intended for both production and research applications. Documentation for the code is in two parts. Part I is a user's manual which emphasizes interpretation of program prompts and choice of user input. Part II stresses internal structure and flow of program control and is intended to assist the researcher who wishes to revise or modify the code or add to its capabilities. PREREM is written for execution on a Digital Equipment Corporation PDP-10

System and much of the code will require revision before it can be run on other machines.

Optical Waveguide Dosimeter.
Patent Application,
Stanley Levine, Stanley Kronenberg, Harry Levine, William L. McLaughlin, and Carl R. Siebentritt. Filed 28 May 81, 8p AD-D008 538/1
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The general object of this invention is to provide a low-cost, portable dosimeter for personnel dosimetry that does not require maintenance and that can be used in civil defense emergencies. A further object of the invention is to provide such a dosimeter that does not require any power source or auxiliary equipment such as a readout device or charger. A still further object of the invention is to provide such a dosimeter that can be stored for long periods and be available instantly for use in case of an emergency. Another object of the invention is to increase the sensitivity of leuko dye dosimetry by several orders of magnitude to make it applicable for emergency personnel dosimetry where doses of 0 to 1000 rads (tissue) are of interest. It has now been found that the foregoing objects can be attained by incorporating a liquid solution of a leuko dye as the core of an optical wave guide. The optical wave guide dosimeter includes the liquid solution of leuko dye hermetically sealed in flexible and transparent plastic tubing.

AD-A100 582/6 PC **A19**/MF **A01**
Undersea Medical Society, Inc., Bethesda, MD.
Thermal Constraints in Diving.
1 Apr 81, 441p Rept no. UMS-PUB-44WS(TC)
Grant N00014-80-G-0056
Proceedings of the Undersea Medical Society Workshop (24th), Bethesda, MD. 3-4 Sep 80.

Despite considerable investigation since the 1974 UMS Workshop, the relationship between body heat loss and core temperature change in cold water exposure has not been definitively elucidated. The relationship appears to be dependent on the rate of cooling in that loss of a given amount of heat at a rapid rate causes a greater drop in rectal temperature and more shivering as compared to loss of the same heat over a longer time which results in little rectal temperature drop, no shivering and only minor complaints of mild cold stress. Although the performance decrement associated with each type of exposure remains to be determined, there has not yet been any explanation of this documented effect of rate of cooling. The effect is pertinent not only to use of the rectal temperature but is applicable to various core temperature measurement sites. New experiments were described that documented the relationship between individual body size and fatness characteristics and cooling rate. For the same body mass and height, variation of body fat was shown to cause a large variation in rectal temperature decrease and heat loss; the fatter the individual, the less the change. For the same body fat percentage, variation of body mass and height has a large effect in rectal temperature and heat loss; the larger the individual, the less the change. People of identical skinfold thickness and sex have enormous differences in rates of cooling.

The Feasibility of a National Biomechanics Data Bank.
Feb 81, 31p
Contract N00014-80-C-0159

The major source of mortality and morbidity of the young adult population in industralized nations is due to impact acceleration from vehicular accidents. One strategy to reduce the mortality and morbidity is the use of protective devices to limit the loads applied to human occupants. The main thrust of a national biomechanics data bank at this time is toward biomechanical and injury data judged to be important for the reduction of mortality and morbidity. Because biomechanical data are expensive to gather, the mutual sharing of such data among laboratories is extremely important and could be accomplished through the establishment of a national biomechanics data bank. However, since the development of a national facility would take time and would itself be extremely expensive, the group feels that the interim measure of standardizing among the several small existing data banks is needed. This would permit retrieval of data from any small bank that is in a format common to the others in terms of nomenclature, units of measure, anatomical coordinate systems, and quality estimates. The common format would then permit eventual collation of small bank data into the national bank with minimal difficulty. (Author)

Toxic Hazards in Aviation.
Conference proceedings.
Apr 81, 133p Rept no. AGARD-CP-309
Presented at the Aerospace Medical Panel Specialist's Meeting, Toronto (Canada), 15-19 Sep 80.

The aviation environment has always contained many toxic materials and products. With the evolution of more advanced aircraft propulsion mechanisms, specialised aircraft material development and associated maintenance activities, there has been a major increase in the potential toxic hazards associated with these systems. The threat of toxic exposure covers the entire spectrum of low-level continuous or intermittent to high-level brief accidental or unavoidable exposures. However, the protection of the crew and passengers is not the only concern in dealing with the toxic hazards in aviation. Responsibilities include research to address the biomedical aspects of occupational health and safety standards, toxic substances, environmental impact criteria and classification of transportation. The Teratogenic Effects of the Fuel JP-10 on the ICR Mice.
Final rept.,
Robert D. Lyng. 31 Mar 81, 8p AFOSR-TR-81-0541
Grant AFOSR-80-0093

JP-10 is a synthesized fuel for Cruise Missiles. It is the exoisomer of 4, 7-methano-1H-indene, octahydro 12a alpha, 4 alpha, 7 alpha, 7a alpha, (CA 2825-83-4). Pregnant ICR mice were given oral doses of 0.2, 0.4, 0.6 and 0.8 ml/kg on days 6 through 9 of gestation. No significant differences were found between controls and experimental groups in mean implants/female, mean viable fetuses/litter, mean resorptions/litter, frequency of resorptions, frequency of soft tissue anomolies and frequency of skeletal anomalies. Mean fetal weight was significantly heavier in the 0.2 and 0.4 ml/kg groups. This effect is difficult to explain when the 0.6 and 0.8 ml/kg groups showed no increase in fetal weight. (Author)

This report quantifies the cutaneous and systemic response of male and female C3H mice to skin application of selected commercial epoxy resins and amine curing agents, at the maximum tolerated dermal dose (MTDD). Resins tested were: diglycidyl ether of bisphenol A (DGEBA) (CAS no. 1675-54-3); mixtures of the same resins with bis(2,3-epoxycyclopentyl) ether (CAS no. 2386-90-5; diglycidyl ether of resorcinol (CAS no. 101-90-6); N,N'-diglycidyl-5,5-dimethylhydantoin (CAS no. 15336-81-9); diglycidyl ether of neopentyl glycol (CAS no. 17557-23-2); A 70:30 mixture of the hydantoin and neopentyl glycol base resins; the amine curing agent menthane diamine (CAS no. 80-52-4); and a dutectic mixture of meta-phenylenediamine (CAS no. 108-45-2) and DGEBA. A DGEBA manufactured by Union Carbide Corporation (Material E, Appendix A) in the mid-1970's and assayed for skin carcinogenicity previously was chemically characterized. The results of this analysis are included with the present data for comparison purposes. Background information on the special statistical methods used is presented in Appendix C. Lack of Effect of 60-Hertz Fields on Growth of Cultured Mammalian Cells.
R. A. Tobey, H. J. Price, L. D. Scott, and K. D. Ley. May 81, 9p LA-8831-MS
Contract W-7405-ENG-36
Microfiche only after original copies are exhausted.

An initial series of studies carried out with a vessel which permitted exposure of cultured CHO cells to 1 mV/m 60-Hz fields yielded a pronounced reduction in growth rate. Because of suspicions that the effects on growth were due to something other than the 60-Hz field, the initial chamber was examined for generation of arcing and coronal effects, and a modified chamber yielding the same order of magnitude of 60-Hz field, but free of electrical artifacts, was utilized for growth studies. The results obtained demonstrated that the effects on growth observed with the initial chamber did not result from the electric field, but instead appeared to be attributable to arcing and coronal effects. (ERA citation 06:024412)

Hematologic and Immunologic Studies of Humans Exposed to SO2,
Mirdza L. Peterson, Shirley Harder, Delores Elliott, Velva Milholland, and Geraldine Orlando. Jun 81, 22p EPA-600/1-81-047

Immunologic and hematologic parameters were used to evaluate the effects in humans of a single 2 hour exposure to either clean air or 0.75 ppm SO2. Venous blood Samples were obtained before, immediately after, and 24, 48, and 72 hours following the end of exposure. Parameters studied included complete blood counts, enumeration of lymphocyte populations using surface membrane receptor markers, evaluation of lymphocyte mitogen stimulated response, and concentration of secretary immunoglobulin A (s-IgA) content of nasal washings. No statistically significant changes were seen in s-IgA, blood erythrocytes or immunologic parameters examined. A possibly significant decrease was found in monocytes 48 hours following SO2 exposure, but this recovered after 72 hours. A stimulatory effect (not statistically significant) was noted at 48 and 72 hours post-SO2 in s-IgA and in lymphocyte numbers bearing receptors for the Fc portion of IgG, while a decrease occurred in active T-lymphocytes with receptors for sheep red blood cells.

A Study of Uremic Toxins.
Final rept. 3 Jan 79-30 Jun 80,
Jonas Bergstroem, Peter Fuerst, and Lena Zimmerman. May 81, 38p AK-6-2-2215-81
Contract N01-AM-2-2215

By using an automatic analytical system endogenous middle molecules were quantitatively determined. Relationships between MM levels in plasma and various clinical parameters in non-dialyzed as well as dialyzed uremic patients were assessed. We found that symptomatic patients (with edema, infection, vomiting, malnutrition and pericarditis) had higher levels of certain MM-fractions in plasma than non-symptomatic controls with the same degree of renal impairment, thus indicating that there is an association between uremic 'sickness' and accumulation of middle molecules. In the dialysis patients 'sickness' was on a statistical basis to a higher degree associated with accumulation of middle molecules than with accumulation of urea and creatinine. Renal clearance of middle molecule fractions were similar to creatinine clearance or slightly higher. Azotemic patients excreted more peak 7c material than did normal subjects and the exretion rates varied more from patient to patient in the azotemic population. By using preparative chromatography, N-terminal and C-terminal amino acid determination, partial hydrolysis, amino acid analysis, isotachophoresis, high voltage paper electrophoresis, gas chromatography/masspectrometry, masspectrometry (direct inlet probe) and elemental analysis, the main fraction of 7c could be fully defined and was found to be glucuronidated o-hydroxy-benzoylglycine with a molecular weight of 371 daltons. The structure has been confirmed by synthesizing the compound and subjecting it to the analytical procedures.

Response of Phytoplankton to Acidification in Experimental Streams.
Master's thesis,
Thomas Walter Weber, II. Jun 81, 52p EPA-600/3-81-042

In order to examine the response of stream phytoplankton communities to acidification, three artificial streams along the Mississippi River were sampled at biweekly intervals. This study took place at Monticello, Minnesota, during late spring-early summer, 1979. One stream served as a control with an ambient pH of 8.1, and two streams were maintained at pH 6.3 and 5.3 by the addition of sulfuric acid. The streams provided a unique replicate system whereby physical and chemical parameters could be controlled and continually monitored in a field situation. The phytoplankton samples were filtered onto membrane filters and the constituent phytoplankton species were enumerated. The diversity of phytoplankton was similar throughout all three pH regimes. However, phytoplankton community similarity decreased over the course of the six week experimental period. Biomass, measured by in vivo chlorophyli fluorescence and as the density of the algal cells, showed a similar pattern. The pattern of algal community development differed across the pH treatments. The phytoplankton at pH 6.3 and 8.1 attained their maximum biomass during the first month of sampling (June). There is a lag in the population maxima of phytoplankton at pH 5.3, possibly due to a slower division rate caused by a less than ideal pH environment. Species composition was nearly identical across the pH range, dominated by diatoms in each stream. The most extreme pH value, pH 5.3, seemed to be a sublethal value for the diatoms existing there.

Reduction of Toxicity to Aquatic Organisms by Industrial Wastewater Treatment.
Journal article,
George A. Cary, and Michael E. Barrows. Jul 81, 72p EPA-600/3-81-043
Contract EPA-68-03-2631

The specific goal of this research was to conduct 24-hour static acute bioassays with 'untreated' influent and 'treated' effluent using fathead minnows (Pimephales promelas) and water flea (Daphnia magna) to biologically evaluate the effectiveness of industrial wastewater facilities in reducing effluent toxicity to aquatic organisms. Of primary interest to the EPA was an evaluation of the capacity of the wastewater treatment facilities of the pesticide industry for reducing toxicity. To accomplish the stated goal, on-site 24-hour static acute toxicity tests were performed during ten consecutive workdays at seven industrial sites. Five of the test sites are defined as pesticide manufacturers, while the remaining sites consisted of an organo-chemical manufacturer and a bleached-kraft paper mill. The effectiveness of the treatment plants was determined by performing static acute toxicity tests with the fathead minnow (Pimephales promelas) and the water flea (Daphnia magna) on samples of the wastewater collected before and after treatment. Results of the studies are expressed in terms of both median lethal concentrations (LC50's) as % effluent and lethal units. The data from these studies indicate that the wastewater treatment plants provided an average efficiency of 98% in reducing the toxicity of 'untreated' wastewaters. Neither species tested proved to be a more sensitive indicator of toxicity, though a larger data base is required to make valid appraisal. Of interest was the observation that while some wastewater treatment facilities provide good efficiency (98+%) in reducing toxicity, the resulting effluent still represented a relatively high number of lethal units. This was a result of the fact that the 'untreated' influent entering the waste treatment system contained a very high level of lethal units and a subsequent 98% reduction of that level still resulted in a toxic wastewater.

EPA-600/1-81-052
Grant EPA-R-805184

The authors have developed a variety of non-invasive and other techniques to study effects of inhaled pollutants on the lung. In the area of airway mechanics they have developed and applied a diameter gauge to make continuous measurements of large airways caliber. The gauge provides an electric output. The authors have also developed and validated rapid methods for non-invasively measuring respiratory mechanics using forced random noise excitation at the mouth. The resulting respiratory impedance data are applied to appropriate models to obtain values for parameters such as 'central' and 'peripheral' airways resistance. In the area of repiratory epithelial function they have developed a nontraumatic technique to measure transepithelial potential difference across respiratory (nasal and airways) epithelium. The authors have also measured tracheal epithelial permeability in vivo, demonstrating increased permeability and decreased permselectivity in guinea pigs exposed to 4 ppm, 1 ppm and 0.3 ppm O3. In the area of pulmonary vasculature, they have developed a rapid noninvasive multi-gas rebreathing technique to measure lung water and used it to develop an O3 - induced pulmonary caine model of delayed pulmonary edema using 1 ppm O3.

Ozone Exposure and Pulmonary Metabolic Effects of Mediators and Hormones.
Final rept. 20 Nov 76-31 Aug 80,
Ibert C. Wells. Jul 81, 25p EPA-600/1-81-051
Grant EPA-R-804585

Several physiological effects of ozone exposure involving smooth muscle contracting substances have been studied in Sprague-Dawley derived, male rats whose body weights were in the range of 180-250 grams and whose ages were in the range of 45-60 days. The ozone concentration of interest was 0.5-1.0 ppm and the exposure time was four hours. However, higher concentrations of ozone and longer exposure times were sometimes employed. It was observed that the exposure of these rats to ozone concentrations of 0.5 or 1.0 ppm for 4.0 hours produced the following effects in their lungs: (a) caused the release of prostaglandin F2 alpha (PGF2 alpha) and thromboxane A2 (TXA2), (b) increased the angiotensin converting enzyme activity, and (c) decreased the uptake of serotonin from the blood. Histamine and slow reacting substance of anaphylaxis (SRS-A) were not released nor was the histamine forming capacity of the lung altered. Edema formation was observed in the rats from one supplier, but not in those from another and succinoxidase activity was observed to be decreased by short exposure to ozone and increased by long exposure, as reported by previous investigators.

Extent-Of-Exposure Survey of Methyl Chloride.
Technical rept.
Joel M. Cohen. Sep 80, 45p DHHS/PUB/NIOSH-80-134
Contract PHS-NIOSH-210-76-0158

Industrial exposures to methyl chloride (74873) are discussed. The toxic effects of methyl chloride are reviewed along with analytical procedures for collection and analysis of methyl chloride samples. Several workplaces that use methyl chloride are described, together with various industrial applications of the chemical. Jobs requiring the use of methyl chloride are identified, and current industrial hygiene and safety practices, including engineering controls, work practices, administrative controls, and biological and environmental sampling and control procedures are described. Chemical and physical data for methyl chloride is presented. The results of detailed industrial hygiene surveys at four United States facilities where the chemical is used are included.

Mortality Study of Pesticide Manufacturers/ Formulators: Documentation of the Velsicol Chemical Company, Memphis, Tennessee Cohort.
Contract rept.,
David P. DiTraglia. 1979, 100p NIOSH-210-76-0173
Contract PHS-NIOSH-210-76-0173

The effects of pesticide exposure were studied in workers employed at the Vesicol Chemical Company (SIC-2879) in Memphis, Tennessee. Data was collected including a list of jobs and departments and work histories. The study group comprised workers with at least 6 months of factory experience prior to the end of 1964. Workers were classified into four study cohorts comprising all workers employed for 6 months or more. Standardized mortality ratios workers employed for 6, 12, or 36 months or more. Standardized mortality ratios (SMRs) were measured according to exposure. As exposure length increased SMR increased substantially. For all malignant neoplasms, SMRs were 91, 95, 100 and 110 percent in cohorts 1, 2, 3, and 4, respectively. For neoplasms of the respiratory system SMRs were 122, 128, 133 and 146 percent in cohort 1, 2, 3 and 4, respectively. Three deaths occurred from malignant neoplasms of the respiratory system, after 10 and 20 years of employment. The authors conclude that the data is not complete and recommend that measures be taken to complete it. If this is not possible, the cohorts should be followed up and the data reexamined.

Comparison of Sequential Flash and Conventional Crude Oil Distillation Processes.
T. W. Mix, J. S. Dweck, J. W. Staigerwald, and I. J. Eilands. Jul 80, 142p DOE/EC/01584-4
Contract AC07-76CS40259
Microfiche only after original copies are exhausted.

A sequential flash crude distillation process is compared with conventional technology for both grassroots and retrofit refinery application. Two versions of the sequential flash process, a dry one and a wet one (requiring steam), are discussed. The sequential flash process is concluded to be operationally sound and likely to be energy conservative and to offer favorable economics for modernization and expansion of a number of refineries. Selection of a specific refinery for demonstration of the sequential flash technology is recommended, with a go-ahead on the demonstration being contingent on an analysis confirming both energy conservation and superior economics to result from retrofit with sequential flash processing instead of conventional processing. (ERA citation 06:023126)

Development of Processes for the Production of Solar-Grade Silicon from Halides and Alkali Metals. Final Report, October 1979-February 1981.
C. R. Dickson, R. K. Gould, and W. Felder. Mar 81, 108p DOE/JPL/955491-81/6, AeroChem-TP-410
Contract NAS-7-100-955491
Microfiche only after original copies are exhausted.

Processes were developed involving high temperature reactions of silicon halides with alkali metals for the production of solar grade silicon in volume at low cost. Experiments were performed to evaluate product separation and collection processes, measure heat release parameters for scaling purposes, determine the effects of reactants and/or products on materials of reactor construction, and make preliminary engineering and economic analyses of a scaled-up process. The process was found to have a low manufacturing cost and the lowest plant cost of all the present JPL sponsored processes, and produces the silicon product at the low price of $10/kg in 1980 dollars. The kinetics and mechanism of the formation and growth of silicon particles from the decomposition of silane at high temperatures is characterized. The experiments were aimed at determining the rates at which gas-phase species form silicon particle precursors, the time required for silane decomposition to produce particles, and the competing rate of growth of silicon seed particles injected into a decomposing silane environment. A high-temperature fast-flow reactor was modified to study the decomposition of silane and the subsequent growth of particles. Optical diagnostics consisting of absorption and Mie scattering of the light at 90 exp 0 from He-Ne or Ar exp + lasers were used to determine the appearance growth rates and absolute sizes of the particles. The extent of silane decomposition as a function of residence time, temperature, and pressure was measured by infrared absorption spectroscopy. A simplistic model is presented to explain the growth of silicon in a decomposing silane environment. (ERA citation 06:023275)

DOE/JPL/955843-81/2
Contract NAS-7-100-955843
Microfiche only after original copies are exhausted.

During this quarter, design of the prototype automated web growth furnace neared completion; layout and detailed drawings of the mechanical components are 90% completed. Mechanical items have undergone design change to reduce cost. Several changes to improve the electronic functioning of subsystems have been implemented. A new melt level control system has been implemented to provide stepless silicon feed rates from zero to rates exactly matching the silicon consumed during web growth. Bench tests of the unit were successfully completed and the system mounted in a web furnace for operational verification. Tests of long-term temperature drift correction techniques were made; web width monitoring seems most appropriate for feedback purposes. We successfully tested a system to program the initiation of the web growth cycle. A low-cost temperature controller was tested which functions as well as units four times as expensive. A design of a recessed growth lid combining features of improved growth speed plus improved starting behavior was experimentally operated for the first time. The predicted improvements were verified. Web crystals constant in width to a fraction of a millimeter were grown using passive width control tecniques. Further growth was limited only by the lack of melt replenishment hardware on the furnace, a feature now being changed. (ERA citation 06:023278)

Factored Estimates for Eastern Coal Commercial Concepts. Interim Report: Joint Department of Energy-Gas Research Institute Coal Gasification Program.
Sep 78, 89p DOE/ET/10250-T1, HCP/T-2240-31,FE-2240-31
Contract AC01-76ET10250
Microfiche only after original copies are exhausted.

Conceptual commercial designs were prepared for BI-GAS, HYGAS Steam-Oxygen and Steam-iron, and Synthane processes to compare the economics with the conventional Lurgi process. Of these processes, only the Lurgi process is commercially

available. With the exception of the Lurgi process, the conceptual plant designs are not based on pilot plant data, but rather are derived from computerized projections of bench-scale and PDU data. It should be appreciated that the computerized projections for the BI-GAS, HYGAS Steam-Oxygen, HYGAS Steam-Iron, and the Synthane processes do not ensure that these processes can be operable at conditions assumed for preparation of these cost estimates. For each of these five processes, capital costs and the cost of operation using an eastern bituminous coal have been estimated to determine the cost of pipeline gas. The accuracy of these Total Plant Investment estimates is estimated to be +-20%. The significance of variations between costs of the processes presented should be considered in the light of this accuracy. Variations in gas costs of all second generation processes from $3.64 to $3.94 per million Btu are probably only indicative rather than significant. The study indicates that these processes might be less costly than the Lurgi process - the gas cost of which is estimated at $4.66 per million Btu. (ERA citation 06:023008)

Oil Shale Surface Retorting: Environmental Characterization Information Report.
Jan 81, 68p DOE/EP-0015
Contract AT03-76EV74010
Microfiche only after original copies are exhausted.

This Environmental Characterization Information Report (ECIR) for Oil Shale, Surface Retorting: Paraho Process (Direct Mode) has been prepared from the latest available environmental and technical information collected from a number of sources. The plant chose for characterization is a 50 x 10 exp 3 bbl/day syncrude equivalent facility using the Paraho Process (Direct Mode). The process, assumed plant operating parameters, resources needed, and the environmental residuals and products associated with the plant are presented. Annual resource usage and pollutant discharges are shown in English and metric units, assuming an annual plant capacity factor of 90%. In addition to annual quantities, the summary table gives quantities in terms of 10 exp 12 Btu of energy (syncrude) produced for comparison between different energy processes. Twenty-one environmental points of interest are discussed individually. (ERA citation 06:023156)

Pipeline Gas Demonstration Plant. Phase I. Annual Technical Progress Report, July 1, 1979-June 30, 1980.
1980, 205p FE-2542-30
Contract AC01-77ET13060

Contract No. EF-77-C-01-2542 between Conoco Inc., and the US Department of Energy requires Conoco Inc. to design, construct, and operate a demonstration plant for the manufacture of high-Btu gas from bituminous coal. The project is currently in the design phase, which is scheduled for completion by June 30, 1981. During the reporting period of July 1, 1979 through June 30, 1980 the main accomplishments were: near completion of Task II, Demonstration Plant Process Design; Task IV, Demonstration Plant Environmental Analysis, was completed and the Environmental Analysis Report (FE-2542-25 Vols. 1 through 6) was issued; applications have been filed for Prevention of Significant Deterioration (PSD) Permit, Permit to Install (PTI), National Pollution Discharge Elimination System (NPDES) Permit and Permit to Build the Water Intake; DOE has approved all but two of the proprietary process licenses required for the Demonstration Plant; and Conoco Inc. has implemented a configuration and resource control plan to manage engineering change, cost growth, and schedule slippage in the engineering tasks. The main design effort in the final year of Phase I will be directed to Task VI, Demonstration Plant Engineering Design; Task VII, Construction Planning; and Task X, Long Lead Time Items. Studies of Molten-Salt-Catalysed Coal Gasification. Final Technical Report.
H. Saltsburg. 13p
Contract FG21-78ET13382

A measurement of the properties of the gasification catalyst itself, which has been made for the first time, provides several insights into the mechanism which were not previously obtainable other than as speculation. The measurement of the oxygen activity in the melt systems demonstrates that for the CO sub 2 based gasification: a) The mechanisms which involve the metal or metal cation in a significant way are inappropriate. b) The effectiveness of solid HOH and Li sub 2 O must be in their ready conversion to carbonates. and c) Therefore, the increased activity of Li sub 2 CO sub 3 relative to K sub 2 CO sub 3 is a result of the m.p. being lower permitting more effective dispersion of the catalyst over the carbon surface rather than an intrinsic difference due to differences between Li exp + and K exp + . It is interesting to note that in other catalytic systems in which alkali metal cations have an effect on the catalytic activity of another material (e.g., Li sub 2 S sub 2 O sub 7 vs K sub 2 S sub 2 O sub 7 on V sub 2 O sub 5 for oxidation of benzene to maleic anhydride exp 8) the Li salt is typically a poison. Low-Rank Coal Study. Volume 4. Regulatory, Environmental, and Market Analyses.
Nov 80, 241p
Contract AC18-79FC10066

The regulatory, environmental, and market constraints to development of US low-rank coal resources are analyzed. Government-imposed environmental and regulatory requirements are among the most important factors that determine the markets for low-rank coal and the technology used in the extraction, delivery, and utilization systems. Both state and federal controls are examined, in light of available data on impacts and effluents associated with major low-rank coal development efforts. The market analysis examines both the penetretion of existing markets by low-rank coal and the evolution of potential markets in the future. The electric utility industry consumes about 99 percent of the total low-rank coal production. This use in utility boilers rose dramatically in the 1970's and is expected to continue to grow rapidly. In the late 1980's and 1990's, industrial direct use of low-rank coal and the production of synthetic fuels are expected to start growing as major new markets. (ERA citation 06:021567)

Large-Area Silicon Sheet by EFG. First Quarterly Report, January 1, 1981-March 31, 1981.
29 May 81, 43p
Contract NAS-7-100-954355

A multiple growth run with three 10 cm cartridges was carried out with the best throughput rates and time percentage of simultaneous three-ribbon growth achieved to date in this system. Growth speeds were between 3.2 and 3.6 cm/minute on all three cartridges and simultaneous full-width growth of three ribbons was achieved 47% of the time over the eight-hour duration of the experiment. Improvements in instrumentation and in the main zone temperature uniformity have been two factors that have led to more reproducible growth conditions in the multiple ribbon furnace. Factors influencing ribbon quality are being investigated through the study of the effect of ambient gas species and concentrations on material properties. Growth of ribbon with the cold shoes characteristic of the high-speed systems has shown that the properties of this ribbon respond to ambient changes in much the same way as when no cold shoes are present. The best cell efficiencies attained for 10 cm wide ribbon grown with cold shoes are still below those obtained without cold shoes (10 to 11% versus 12 to 13%, respectively). It has also been shown in these experiments that meniscus CO sub 2 and quartz introduced in the melt (contained in graphite crucibles) are equivalent in improving the electronic quality of the ribbon in these systems. Development of a system to grow 10 cm wide ribbon in the speed range from 3 to 4 cm/minute without the use of the conventional cold shoes is underway. Work on building a new multiple furnace for growth of four 10 cm wide ribbons has been started. (ERA citation 06:023272)

Materials Problems in Fluidized-Bed Combustion Systems: Review of the Information on Gas Turbine Materials in Coal Combustion Environments.
R. L. McCarron, and D. A. Grey. Aug 80, 183p

This report condenses into a single document the available information related to the performance of gas turbine materials operated in the effluent from the combustion of coal. The information summarized originated from three sources: work performed in the period 1940-1970 to establish the potential for a direct coal-fired gas turbine, actual operating experience of gas turbines in particulate-laden environments, and recent efforts to evaluate gas turbines for firing with a pressurized fluidized-bed combustor. Results of these studies show clearly that the potential for erosion, corrosion, and deposition exists in gas turbines operated on coal to the extent that the performance and endurance may be substantially reduced. The choice of gas turbine materials strongly influenced the lifetimes of components exposed to coal-derived environments. Bare alloys, such as IN-738, U-700, and X-40, exposed to the hot gas path degraded more rapidly than MCrAlY coatings or claddings which produce protective layers of alumina or chromia. Extremely hard coatings containing high concentration of carbides in a ductile matrix were particularly resistant to erosion. The interaction between corrosion and erosion appears to be synergistic; however, the exact relationships between these processes are still unknown. (ERA citation 05:034063)

Hydrogen Production Using Solid-Polymer-Electrolyte Technology for Water Electrolysis and Hybrid Sulfur Cycle.
J. M. Sedlak, J. H. Russell, A. B. LaConti, D. K. Gupta, and J. F. Austin. Sep 79, 130p

An evaluation was made of the comparative technoeconomics of hydrogen production using the General Electric Company's solid polymer electrolyte technology in two advanced processes: Water Electrolysis and Hybrid Sulfur Cycle Water Decomposition. In water electrolysis, based on the solid polymer electrolyte, only purified water is fed to the cell. The cell voltage is typically 1.65V at 1000 amp/ft exp 2 (ASF), 300 psia and 300 exp 0 F. The sulfur cycle electrolyzer requires a feed stream of water and sulfur dioxide in concentrated sulfuric acid (50-80%). The cell reaction in this case is: 2H sub 2 O + SO sub 2 implies H sub 2 SO sub 4 + H sub 2 . Stoichiometrically formed sulfuric acid must be subsequently decomposed at very high temperature to recover the sulfur dioxide for recycling. An experimental solid polymer electrolyte sulfur cycle electrolyzer projected a voltage of 0.69 volts at 186 ASF in 50% H sub 2 SO exp 4 at 300 psia and 183 exp 0 F. Undesirable sulfur and sulfide byproducts were detected at the cathode. Comparative costs of producing hydrogen by solid polymer electrolyte water electrolysis, and by solid polymer electrolyte sulfur cycle electrolysis, were determined on the basis of performance and economic analysis of plants running at a level of 380 million SCFD. The optimum solid polymer electrolyte water electrolysis plant operates with an overall efficiency of 40.2% at 1000 ASF and a hydrogen gate price of $2.25 per thousand SCF (at 1976 cost levels). A highly optimistic assessment of solid polymer electrolyte sulfur cycle plant indicated an overall efficiency of 42.5% at 400 ASF. The hydrogen gate price (at 1976 cost levels) was 9.8% higher than for solid polymer electrolyte water electrolysis. The principal conclusion of this study is that the solid polymer electrolyte-based hybrid sulfur cycle process shows no technological or economic advantage over existing (solid polymer electrolyte-based) water electrolysis systems for the production of hydrogen. (ERA citation 05:017463)

Development of Processes for the Production of Solar Grade Silicon from Halides and Alkali Metals, Phase 1 and Phase 2.
Final Report, Oct. 1979 - Feb. 1981.
C. R. Dickson, R. K. Gould, and W. Felder. Mar 81, 66p NASA-CR-164480, DOE/JPL-955491-81/6
Contract JPL-955491
Sponsored in Part by Doe Prepared for JPL.

High temperature reactions of silicon halides with alkali metals for the production of solar grade silicon are described. Product separation and collection processes were evaluated, measure heat release parameters for scaling purposes and effects of reactants and/or products on materials of reactor construction were determined, and preliminary engineering and economic analysis of a scaled up process were made. The feasibility of the basic process to make and collect silicon was demonstrated. The jet impaction/separation process was demonstrated to be a purification process. The rate at which gas phase species from silicon particle precursors, the time required for silane decomposition to produce particles, and the competing rate of growth of silicon seed particles injected into a decomposing silane environment were determined. The extent of silane decomposition as a function of residence time, temperature, and pressure was measured by infrared absorption spectroscopy. A simplistic model is presented to explain the growth of silicon in a decomposing silane enviroment.

Water Treatment in Textile Industry.
Monograph rept.
Mar 71, 24p

Textile mills in places like Bombay city are fortunate in getting water supply which is excellent for use in boilers and for wet processing. But mills in most other places have water supply that is unsuitable and needs proper treatment. But a majority of these mills use raw water only for boilers and processing. Various types of water treatment that are recommended, the cost of such treatments and the benefits that accrue are discussed. While this report is mainly intended for member textile mills where boilers are of low pressure, it is generally applicable to other members of ATIRA that manufacture textile chemicals and auxiliaries. Boilers of medium and high pressure are rarely used in textile industry and as such special problems relating to feed water for such boilers are not dealt with here.

Review of the Preparation of Y-Alumina and the Prospects of Production from Local Raw Materials (Oorsig van die Bereiding van Y-Alumina en Vooruitsigte vir die Produksie uit Plaaslike Grondstowwe),
M. G. Howden. Mar 80, 23p CSIR-CENG-313, ISBN-0-7988-1759-3
Text in English and Afrikaans.

The calcination of relatively pure gibbsite (aluminium hydroxide) under controlled conditions produces gamma-alumina of catalytic grade. The properties of the gamma-alumina relevent to its function in catalysis are related to the method of preparation. The primary source of gibbsite for gamma-alumina production is bauxite, but secondary or alternative sources of aluminium can also be used. As substantial high-grade deposits of bauxite have not been found in Southern Africa, industrial scale production of gamma-alumina from that local material is unlikely to be an economic proposition.

Sub-Optimal Control of Sequences in the Functioning of an Epitasis Reactor in Liquid Phase (Commande sous Optimal des Sequences de Fonctionnement d'un Reacteur d'Epitaxie en Phase Liquide).
Doctoral thesis,
Boutaib Dahhou. 27 Jun 80, 147p ORDER-2364
Text in French.

Among the different techniques for fabricating electronic components such as diffusion, ionic implantation, epitasis (in gaseous phase, liquid phase, through molecular jets), epitasis in liquid phase is a relatively recent development with numerous advantages; equipment easier to operate, larger speeds of depositing layers and greater choice of materials, but it calls for extra attention to the optimal command of the functioning of the thermal reactor. The procedure consists of a progressive cooling of a solution contained in a graphite crucible in the center of the reactor, beginning with a thermal profile in equilibrium. What is needed is a study for the complete automation leading to numerical control by micro-calculator. The epitasis reactor is made up of two concentric quartz cylinders (one transparent; one opaque) placed in the center of a heat insulated casing. Heat is provided by five identical resistors placed along the length. The basic technique for epitasis is the creation of thin, mixed levels (fraction of micron to a few microns) on a monocrystalline substratum serving as a solution, for liquid epitasis. Liquid epitasis is used for achieving levels of arsenic of gallium (GaAs). The process is described in a mathmatical model.

Contract GRI-5014-310-0256
Prepared in cooperation with Dravo Engineers and Constructors, Pittsburgh, PA., and Williams Brothers Engineering Co., Tulsa, OK.

This report describes the work conducted by the Institute of Gas Technology, Dravo Corporation, and Williams Brothers Engineering Company during Phase I of the two-phase program sponsored by the Gas Research Institute. The literature and state-of-the-art of peat resources; peat harvesting, dewatering, and beneficiation technologies; peat gasification feedstock requirements; and the environmental effects of large-scale peat utilization are reviewed. Various estimates of U.S. peat resources are presented. Dry and wet peat harvesting methods commercially used in Russia, Ireland, Finland, Canada, and the U.S. are described, and the economics of peat harvesting are reported. Peat beneficiation (wet-carbonization) processes, mechanical and thermal methods of dewatering peat, and the economics of each are also described. Peat thermal and biological gasification test results are presented, and feedstock requirements (moisture content, particle size) are outlined. Further research needs in all areas of the total system of peat utilization are identified. The results of this study promote the optimistic view that the development of peat as an energy source can be ecologically sound with minimal long-term environmental impacts.

Sulfuric acid production from sulfur-based acid plants and smelters is analyzed. Industry competition, with particular emphasis on voluntary versus abatement acid, is reviewed. Regionally, even though smelter acid is geographically limited, competition is at least moderate. Production costs for both acid plants and smelters are estimated. Due to the byproduct nature of the latter, assigned costs and acceptable producer price are much the lowest. Large-scale users will prefer sulfur-based acid production if the heat value of the reaction can be utilized as a steam credit. Additionally, volunatry acid is a more stable supply source than smelter acid. Voluntary acid output is a reaction to price and demand conditions. Abatement acid production depends on APC implementation and the state of the relevant metals markets. Even if copper, lead, and zinc output remains at current levels, if current EPA regulations are implemented, acid output will approximately double. An output forecast is made based on APC regulations, implementation, and estimated metals production. As a direct competitor to U.S. acid and as indirect competitors to Frasch sulfur, Canadian and rest-of-world acid output is reviewed.

Comparison of Semiautomatic and Fully Automatic Water Titrators.
H. W. Middleton. 22 May 81, 17p
Contract AC04-76DP00656

Semiautomatic titration of water using the Karl Fischer single solution conductometric method takes an average of 5 to 15 minutes per test. A new, fully automatic titrator is available that can complete titration at an average rate of three to ten minutes per test. The automatic method of titration is internally standardized (electrically) at all times, eliminating the two hour (average) standardization period required by the semiautomatic method. A digital readout register displays results in micrograms of water, disposing of manual calculations for one gram samples. Identical samples were tested by both the semiautomatic and the automatic methods, resulting in equally accurate calculations of water content. (ERA citation 06:022327)

On-Line Zeeman Atomic-Absorption Spectroscopy for Mercury Analysis in Oil-Shale Gases. Final Report.
D. C. Girvin, and J. P. Fox. Mar 81, 108p
Contract W-7405-ENG-48

This report describes an instrumental technique to continuously measure total mercury in gas streams on a real-time basis. The technique utilizes Zeeman atomic absorption spectroscopy (ZAA) for on-line measurement of mercury in the presence of smoke, organic vapors, and oil mist which are typically present in offgases from oil shale processing plants. The accuracy of the ZAA background correction technique enables analytical measurament of mercury with up to 95% attenuation of the 2537A analytical line by broadband uv absorption. Furnaces with optical absorption tubes of different lengths are used depending upon the mercury concentration. Between 5 and 250 ppB (nanomoles Hg/mole of gas) of mercury in an 18-cm furnace is used. The instrumental response with this furnace is characterized by a detection limit (DL) of 2 ppB, a linear response up to 100 ppB, and a precision of +- 7% or better. In the 50 ppB to 1.6 ppM range, a furnace with a 5-cm optical absorption tube yields a DL of 10 ppB, a linear response up to 800 ppB, and a precision of +- 10% or better. Sample gas flow rates can be varied between 400 and 4000 scc/min for either furnace. 35 figures, 3 tables. (ERA citation 06:023964)

Systematic Error in Isotopic Analysis of Noble Gas Mixtures.
R. E. Ellefson. 1981, 2p CONF-810548-5
Contract AC04-76DP00053
29. annual conference on mass spectrometry, Minneapolis, MN, USA, 24 May 1981.

Analyses of known standard mixtures of helium-neon, helium-argon, and helium-xenon, show significant biases in measured ratio which change with sample (inlet) pressure. Bias magnitude appears dependent on component partial pressure and not total sample pressure. Quantitative gas analysis assumes a linear relationship between measured ion current, I/sub i/, and partial pressure, PP/sub i/, of a corresponding component in the inlet system: PP/sub i/ = I/sub i//S/sub i/ where S/sub i/ is the sensitivity parameter (assumed constant). For this mass spectrometer, sensitivity is not constant but varies with pressure and is different for each gas. Ion current from a mole fraction, X/sub i/, is related to source pressure, P/sub S/, and ion production factor, K/sub i/, by I/sub i/ = K/sub i/X/sub i/P/sub i/ = K/sub i/(F/sub I//F/sub S/)(1 + (F/sub S//Fsub H/))X/sub i/ P/sub I/. Identifying X/sub i/P/sub I/ as PP/sub i/, sensitivity is given by S/sub i/ = K/sub i/(F/sub I//F/sub s/)(1 + (F/sub S//F/sub H/)). Nonlinear operation can arise from three factors determining sensitivity. Factor K/sub i/, if it varies at all, should depend on total pressure, not partial pressure. Conductance effects of the molecular leak (F/sub I/) and source exit ports (F/sub S/) should have positive slopes for all gases if deviations from molecular flow were significant. Changes in diffusion pumping speed (F/sub H/) by varying the power produce sensitivity changes. Reciprocal of sensitivity changes reflect change in F/sub H/. The variation shown is attributed to changes in F/sub H/ from a cooling effect on pumping fluid with increased gas load. Independent flow of gas components implies that the use of a sensitivity, S/sub i/, appropriate for the partial pressure of the component should minimize systematic errors in ratios: S/sub i/ = S/sub o//sub i/ (1 + S/sub i/ (X/sub i/ P/sub I/)). Applying this model to the data reduced the systematic error. (ERA citation 06:023965)

Grant DAAG29-78-G-0155

Reaction studies of elemental fluorine with organic molecules has lead to an understanding of mechanisms of the addition of molecular fluorine to unsaturated carbon-carbon bonds. The sensitivity of the activation energy of molecular fluorine to various molecular properties has been explored through extensive studies of closely related hydrocarbons. The effect of heteroatoms in a variety of hydrocarbons has also been explored. The studies of molecular fluorine reactions with inorganic fluorides has led to the identification of many new unstable fluorine species such as UF5 MUFx where M is an alkali atom and x varies from four to seven. Studies of the interaction of inorganic fluoride species has provided insight into the Lewis base character of transition and main group metal fluorides. The study of interactions and reactions of metal atoms with small Lewis bases has provided an understanding of the important intermediate steps in the reductive chemistry of water and methane with various metals. Novel experimental approaches to the preparation of new metal oxyfluorides and nitrifluoride are also described. (Author)

Laser Fluorescence Detection for High-Performance Liquid Chromatography.
M. J. Sepaniak. Feb 81, 155p
Contract W-7405-ENG-82
Thesis.

The excellent sensitivity and selectivity of high performance liquid chromatography (HPLC) with laser fluorescence detection is demonstrated with examples in the biological and environmental fields. The spectral advantages of laser excitation for fluorescence HPLC detection, most notably the high output power of the laser, were discussed and then illustrated for the low picogram level determination of the antitumor drugs adriamycin and daunorubicin in body fluids, and for the characterization of coal-derived asphaltenes. A unique optical fiber-flow cell, designed to be compatible with the characteristics of the laser, provided good stray light rejection and efficient fluorescence signal collection, while maintaining chromatographic efficiency. The complex nature of coal-derived asphaltene samples made their analysis extremely difficult. The sensitivity of laser fluorometric detection permitted small injection quantities. Laser fluorescence, laser two-photon excited fluorescence, and uv absorbance detection were used for this purpose. The asphaltene chromatograms from these detectors were shown to be distinctive. Grant NSG-1539

Eight glycidyl amines were prepared by alkylating the parent amine with epichlorohydrin to form chlorohydrin, followed by cyclization with aqueous NaOH. Three of these compounds contained propargyl groups with postcuring studies. A procedure for quantitatively estimating the epoxy content of these glycidyl amines was employed for purity determination. Two diamond carbonates and several model propargly compounds were prepared. The synthesis of three new diamines, two which contain propargyloxy groups, and another with a secbutyl group is in progress. These materials are at the dinitro stage ready for the final hydrogenation step. Four aromatic diamines were synthesized for mutagenic testing purposes. One of these compounds rapidly decomposes on exposure to air.

Novel quarternary ureidomethyl phosphonium salts having the general formula are prepared by condensing a urea having the formula RNHC(0)NR(1)R(2) with a quaternary hydroxymethyl phosphonium salt having the formula (HOCH2)4P(+1)X(-1) -in a molar ratio of at least 2:1. The products, which are characterized by the absence of residual hydroxymethyl groups, are useful as finishing agents for imparting flame retardant properties to cotton fabrics.

Affinity Crosslinking for Enzyme Technology.
Final rept. 1 Oct 79-31 Mar 80,
Patrick E. Guire. Mar 80, 13p NSF/RA-800533
Grant NSF-DAR79-17512

The objective of this project was to develop a new class of stepwise affinity crosslinking reagents that will covalently immobilize and stabilize enzymes and other binding proteins selectively from crude mixtures. Tri- and poly-functional stepwise crosslinking reagents that contain both photoreactive and ligand groups were synthesized. The photoaffinity carrier materials prepared from these were selected to be hydrophilic and nonionic in order to reduce the nonspecific binding of proteings and thereby increase their specificity in the photochemical immobilization step. Agarose derivatives were prepared with homocysteine spacer arms containing the photoreactive azidonitrophenyl group on the amino nitrogen and the ligand dinitrophenyl group (N-DNP-mercaptoethylamine) linked reversibly to the sulfhydryl group. These photoaffinity carrier derivatives were used to preferentially immobilize covalently specific antibody and albumin binding proteins from crude antiserum. An immobilization yield of approximately 50 percent was demonstrated. The technological feasibility of this approach is experimentally indicated.

Ultratrace Speciation and Biogenesis of Methyltin Transport Species in Estuarine Waters.
Interim technical rept.,
F. E. Brinckman, J. A. Jackson, W. R. Blair, G. J. Olson, and W. P. Iverson. 1981, 40p Rept no. NBS-5610406-TR-5
Contract N00014-81-F-0013

Environmental tin, widely dispersed at low concentrations in waters, sediments, and biota, is now perceived to be a bioactive element susceptible to methylation and even hydridization by marine bacteria. Nonetheless, the redox cycle of tin in natural waters is poorly understood and recent advances in tin-specific molecular characterization fail to speciate Sn(II) and Sn(IV) reliably. On the other hand, such rapid developments in speciation methodology now permit growing numbers of studies of organotin distributions in aquatic systems, raising the question of the natural biogeochemical flux of methylstannanes in relation to increased anthropogenic organotin influx from industry and shipping. New methods for direct speciation of aquated or involatile organotins by liquid chromatography are compared with advances in purge-and-trap sampling of volatile or hydrophobic organotins speciated by gas chromatography. The work in our laboratory indicates that effective models for estuarine formation and transport may ultimately be developed, that the basic roadblocks to progress stem from inadequate descriptive aqueous organometallic chemistry and knowledge of critical kinetic parameters for the lifetimes of key organotin species in sea water. The Effect of Activation Energy on Tubular Reactor Multiplicity.
Technical summary rept.,
Robert F. Heinemann, and Aubrey B. Poore. Apr 81, 15p Rept no. MRC-TSR-2201
Contract DAAG29-80-C-0041

The effect of activation energy on the steady state solutions exhibited by the nonadiabatic tubular reactor is investigated by applying numerical bifurcation techniques to the model equations. As the activation energy is increased, the solution branch becomes more complex and finally evolves into a multiplicity pattern with regions of one, three, five and seven solutions. Only the states of lowest and highest temperature are found to be stable. This work confirms recent results using large activation energy asymptotics and links these results to previous numerical studies of reactor multiplicity employing low to moderate values of activation energy. A Nonlinear Volterra Integrodifferential Equation Describing the Stretching of Polymeric Liquids.
Technical summary rept.,
P. Markowich, and M. Renardy. May 81, 63p
Rept no. MRC-TSR-2213
Contract DAAG29-80-C-0041, Grant NSF-MCS79-27062

We study a model equation for the elongation of filaments or sheets of Polymeric liquids under the influence of a force applied to the ends. Mathematically this equation has the form of a nonlinear Volterra integrodifferential equation with the kernel given by a finite sum of exponentials. The unknown function denotes the length of the filament or, respectively, the thickness of the sheet. We study the equation both analytically and numerically. The force is assumed to converge to zero exponentially as t approaches minus infinity and to vanish identically after a finite time t sub 0. It is shown that under this condition there is a unique solution which approaches a given limit as t approaches minus infinity; moreover, the solution also has a limit as t approaches plus infinity. A numerical scheme is analyzed and convergence uniformly in t is established. Particular attention is paid to the dependence of solutions on a parameter mu, which corresponds to a Newtonian contribution to the viscosity. It is proved that solutions converge uniformly in t as mu approaches, and that the convergence of the numerical scheme is also uniform in mu. (Author)

The low-frequency dielectric properties of resins provide a useful tool for characterization both of the curing process and of fully cured material. We have used integrated circuit technology to develop a miniaturized dielectric probe that combines small size with built-in amplification to achieve sensitivity at frequencies as low as 1 Hz. The device combines a planar interdigitated electrode structure with a pair of matched field-effect transistors. The microdielectrometer 'chip' can be implanted in a specimen, or a small sample of material (a few milligrams) can be placed on the active area of the device. When combined with an off-chip electronic feedback system, the device can be used to measure the complex dielectric constant of the sample material either as it cures, or after cure. The device is capable of operating at temperatures up to 200 C, making it useful for a wide variety of curing and post-cure studies. Device calibration is based on a two dimensional computer model which has been experimentally confirmed for a variety of control samples. Several typical applications are illustrated by experiments, and the use of the data to follow changes in the dominant low-frequency dielectric relaxation during the cure of a model epoxy resin system are presented. Contract N00014-80-C-0533

The molecular structures of partially cured polyaminopropylsilsesquioxane and aminopropyltriethoxysilane in water have been studies using Fourier transform infrared, laser Raman and quasielastic laser light scattering spectroscopy. We propose a multiple hydrogen-bonded structure for the intramolecularly interacting amine and silanol groups using isotope exchange experiment and conformational energy calculations. Conformational restrictions are rather low for the proposed structure thus suitable for the partially cured solid where there are slight perturbations by the surrounding amine and silanol groups. The O....N distance was experimentally determined to be in the range 2.70 - 2.67A and estimated theoretically as 2.49 - 2.45A. The aminosilane in very dilute solution was found to be mostly monomeric. The isolated monomer-oligomer transition lies around 0.15% by weight and this transition influences the amount of silane uptake by glass fibers. It is also proposed that this phenomenon may be general for surface treatments by silane coupling agents. Hydrolyzed aminosilane oligomers exist in part as submicron aggregates which can be broken up by the addition of an alcohol. The neutralized aminosilane hydrolyzed very slowly although it dissolved into water instantaneously. A micelle formation was also proposed. (Author)

Robert F. Davis. 5 Jun 81, 20p ARO-12487.7-MS
Grant DAAG29-75-G-0113

The transition metal carbides possess a combination of some of the highest melting points, hardness values and mechanical strengths of any known materials. The contemporary interest in these materials in structural and cladding applications at temperatures where most materials would be molten or would seriously degrade made it imperative that the high temperature diffusion and deformation processes and their relationship to each other be understood. Thus, the principal thrusts of this ARO-sponsored program have been the conduct of self-diffusion studies of 14C and 95Nb in single crystals of NbC0.868 NbC0.834 and NbC0.766 and constant stress compressive creep research on the same materials. Extensive characterization of these materials has also been performed.

Stochastic Photolysis: A New Method for Measuring Rates of Photosensitive Reactions.
Interim technical rept.,
G. R. Haugen, G. M. Hieftje, L. L. Steinmetz, and R. E. Russo. 25 Jun 81, 33p Rept nos. TR-38, 46
Contract N00014-76-C-0838

A new method is introduced for the measurement of photochemical or photobiological reaction rates. Based on linear response theory, the method uses a randomly modulated light source rather than a pulsed one, and employs cross-correlation analysis to extract the desired kinetic information. In operation, a randomly varying light source illuminates the reaction of interest, and the resulting fluctuations in reactant (or product) concentrations are monitored. Mathematical or instrumental cross correlation of the light source variations with those in component concentration then produces the familiar kinetic decay curve. Because the new method produces only minute concentration fluctuations, it can measure reaction rates very near equilibrium; moreover, equilibrium position can be shifted by superimposing on the fluctuating light intensity a dc level. Also, because cross correlation is employed, the method enjoys high signal-to-noise ratios. In the present study, the utility and practicability of the new technique are demonstrated through examination of the recombination kinetics of photolytically generated iodine atoms. (Author)

Triply Differential Studies of Atomic and Molecular Photoionization Using Synchrotron Radiation.
Summary questionnaire 1 Jun 80-30 Sep 81,
J. L. Dehmer, Albert C. Parr, and Roger Stockbauer. 6 Jul 81, 9p
Contract N00014-81-F-0005

Basic studies of the dynamics and spectroscopy of atomic and molecular photoionization have been carried out using three experimental probes. The first and most extensively used experimental approach involves triply differential (differential in incident wavelength, electron energy, and ejection angle) photoelectron measurements using synchrotron radiation. Measurements were conducted in the vacuum ultraviolet wavelength range up to h(nu) about 35 eV on several atomic and molecular species, e.g., Ar, Kr, Xe, H2, N2, O2, CO, SO2, C2H2, C2N2, HCN, CH3CN, BF3, and SF6. Photoelectron branching ratios and angular distributions were obtained for all accessible states. A major emphasis of this work involved the initial exploration of novel effects of autoionization and shape resonances on alternative vibrational ionization channels. The second experimental approach entailed measuring the polarization of fluorescence following production of excited molecular ions by photoionization. This was also a novel experiment, allowing the direct measurement of the alignment of molecules ions produced by photoionization and, simultaneously, the branching ratios for degenerate photoelectron channels. The third experimental approach was, again, a novel experiment, and involved determining the photoelectron spectrum of an atomic cluster (Xe3) in a mixture of clusters formed in a supersonic expansion by the technique of photoion-photoelectron coincidence. The rotational line scan diagnostic technique described in this report can be used to derive the time history of the rotational temperature, the ground state DF population and the population in the first excited state during the output pulse of an atmospheric pressure DF laser from measurements of gain/absorption on three adjacent rotational lines in the 1-0 vibrational band. A description of the theoretical foundations of this technique is given together with sample calculations for typical pulsed DF laser conditions. An experimental system using a low pressure cw probe laser has been assembled for application on the AFWK Mjollnir laser. The design, assembly, alignment and operation of this diagnostic system are described in detail. Within operational limitations imposed by the probe laser, the performance of the diagnostic system has been verified using a pulsed gain cell. (Author)

The reported physics research is part of an overall program to develop a nuclear magnetic resonance gyro that makes use of an optically pumped alkali metal vapor both to align the magnetic moments of the noble gas nuclei and to detect the weak magnetic fields that are generated by these precessing nuclear moments. Theoretical and experimental investigations are reported on the relaxation of polarized nuclear spins of Xe131 through the interaction of the nuclear quadrupole moment with the electric field gradient. The field gradient arises from deformation of the otherwise spherical electronic shell of the zenon atom.

Some laser-induced reactions of BF3, BCl3 or B(CH3)3 with NF3, N2F4 or C2H4 have been studied. These reactions were initiated by the multiphoton absorption of the infrared radiation from a CW CO2 laser. In addition to numerous gaseous products, infrared spectra of solids, that have been identified as belonging to BF4 and BN, were observed. When possible, visible emission, which accompanied some of the reaction, was photographed. Analysis has shown it to be due, in part, to C2 and CN when carbon was present and a continuum for a BCl3 and N2 mixture. (Author)

The processes of the intercalation of graphite, the desorption of intercalated graphite, and the exfoliation of intercalated graphite have been studied by using x-ray diffraction, x-ray absorption, optical microscopy, thermogravimetry, dilatometry and acoustic emission measurement. Emphasis was given to the structural changes which occur during these processes and the kinetics of these processes. For bromine intercalation, it was found that intercalation does not involve a progressive change in stage, although the final stage (n) may be dominated by the next higher stage (n+1) during the early part of the intercalation process. Furthermore, it was confirmed that the final stage increases with increasing temperature for the same intercalate activity, and that the rate of interaction increases with increasing temperature. On the other hand, desorption was found to involve a progressive increase of stage. Moreover, desorption was found to begin at the edge of the sample, resulting in a difference in stage between the edge and central regions of the c-face; the concentration gradient was found to increase with decreasing stage. The amount of expansion observed on exfoliation was found to be determined principally by the parent stage formed during intercalation; the higher is the stage of the parent, the larger is the amount of expansion.

Contract N00014-80-C-0532, Grant NSF-DMR76-80847

Vibrational spectroscopic and conductivity data are presented for complexes of NaBF4 and NaBH4 with poly(ethylene oxide). These studies indicate that extensive contact ion pairing occurs in the NaBH4 complex but not in the NaBF4 complex. As a result the ionic conductivity is considerably lower in the NaBH4 complex, due to trapping of the mobile sodium cations by the anion. The effect of salt stoichiometry on the conductivity behavior is also reported. (Author)

Collisional Excitation of H2O and CO2 by O(3P) Atoms.
Final technical rept. 1 Oct 79-11 Sep 80,
Rodney J. Bartlett, and Michael J. Redmon. Feb 81, 108p AFRPL-TR-81-27
Contract F04611-79-C-0024

Theoretical calculations of the molecular excitation cross sections for: O(3P) + H2O(1A1) and O(3P) + CO2 (1 sigma g+) collisions were made as a function of velocity over the range 2-10km/sec. Potential surfaces for these reactions were computed using the many body perturbation technique. Trajectory calculations were performed with a Monte Carlo quasi-classical trajectory technique. To obtain an accurate analytical fit of the potential surface a many body force field was employed. Also to obtain good action angle variables a technique was developed to perform final state analysis. The results for H2O are insensitive to within a factor of 2 for substantial changes in the fit parameters. This provides a measureable degree of confidence of the predicted results. Representative values for H2O (001) + 0 are 2.0 x 10 to the minus 7th power sq cm at 4km/sec and 2.0 x 10 to the minus 16th power at 6km/sec. The results for CO2 + 0 are not as reliable due to the use of a simplier fit of the surface. The results for C02 show that excitation of NN'I states is more probable by up to two orders of magnitude than direct excitation of the 001 state. If radiation from the 001 state is observed then a multiple collision environment probably exists. Representative values for CO2 (001) + 0 are 3.0 x 10 to the minus 19th power at 6km/sec and 2.5 x 10 to the minus 18th power at 8km/sec.

Real Time Mass Flux Measurements of Gas-Solid Suspensions at Low Velocities.
J. H. Saunders, B. T. Chao, and S. L. Soo. 1981, 13p CONF-810581-1
Contract AC02-76CH00016
Powder and bulk solids conference, Chicago, IL, USA, 12 May 1981.

In previous work, measurement of the particulate mass flux was made based upon a novel electrostatic technique. A small conducting wire sensor was inserted in the flow and as each particle hit the sensor an individual pulse of current was identified. Through suitable electronic circuitry, the number of pulses in a given time were counted. This was a direct measure of the number of particle-probe collisions which was related to local particle mass flow. The technique is currently limited to monodisperse suspensions. A primary advantage of the impact counter system is that the output does not depend upon the magnitude of the actual charge transfer. As long as the pulses are sufficiently above the noise level, variations in charge transfer will not affect the measurement. For the current work, the technique was applied to vertical gas-solid flow where the fluid velocity was slightly above the particle terminal velocity. Under these conditions a sufficient signal to noise ratio was not found. The Cheng-Soo charge transfer theory indicated that the low particle-sensor impact velocity was responsible. The probe system was then modified by extracting a particulate sample isokinetically and accelerating the particles to a sufficient velocity by an area reduction in the sampling tube. With this technique the signal to noise ratio was about 12 to 1. Mass flux results are shown to compare favorably with filter collection and weighing. (ERA citation 06:024031)

Laser-Induced Chemical Reactions.
A. E. Orel. Dec 80, 126p LBL-12089
Contract W-7405-ENG-48
Thesis.
Microfiche only after original copies are exhausted.

A classical model for the interaction of laser radiation with a molecular system is derived. This model is used to study the enhancement of a chemical reaction via a collision induced absorption. It was found that an infrared laser will in general enhance the rate of a chemical reaction, even if the reactants are infrared inactive. Results for an illustrative analytically solvable model are presented, as well as results from classical trajectory studies on a number of systems. The collision induced absorption spectrum in these systems can be written as the Fourier transform of a particular dipole correlation function. This is used to obtain the collision induced absorption spectrum for a state-selected, mono-energetic reactive collision system. Examples treated are a one-dimensional barrier problem, reactive and nonreactive collisions of H + H sub 2 , and a modified H + H sub 2 potential energy surface which leads to a collision intermediate. An extension of the classical model to treat laser-induced electronically nonadiabatic collision processes is constructed. The model treats all degrees of freedom, molecular, electronic and radiation, in a dynamically consistent framework within classical mechanics. Application is made to several systems. Several interesting phenomena are discovered including a Franck-Condon-like effect causing maxima in the reaction probability at energies much below the classical threshold, laser de-enhancement of chemical reactions and an isotope effect. In order to assess the validity of the classical model for electronically nonadiabatic process (without a laser field), a model problem involving energy transfer in a collinear atom-diatom

system is studied, and the results compared to the available quantum mechanical calculation. The calculations are in qualitative agreement. (ERA citation 06:024448)

Manual for the Fourier Data Analysis Program, Code: FA1, Version/1.2/, Operating System: RT-11. Volume 1 and Volume II.
P. D. Murphy. May 81, 168p IS-4769
Contract W-7405-ENG-82
Microfiche only after original copies are exhausted.

This report contains the manual for the Fourier Data Analysis Program FA1, Version/1.2/. This interactive computer program was developed to perform spectral analyses with special applications to nuclear magnetic resonance (NMR). The program is designed to run on digital PDP-11 computers under the RT-11 monitor. Tasks performed by the program include: second-order least-squares baseline corrections; zero-order and linear phase adjustments; broadband spectral compensations; convolution of discrete spectra; addition and subtraction of spectra; incremental plots; Fourier transforms; resolution and sensitivity enhancements; data normalizations; polar/rectangular conversions; data smoothing; calculations of areas, first and second moments; calculation of segments of large fourier transforms; and spectrum synthesis. This report contains two volumes. The first volume describes the program and shows illustrations and examples of FA1 command usage. The second volume contains an in-depth discussion of FA1 commands. Study of Ring and Ring-Disk Electrodes.
P. E. Pierini. May 81, 117p LBL-12776
Contract W-7405-ENG-48
Thesis.
Microfiche only after original copies are exhausted.

Rotating ring and ring-disk electrodes were modeled. The primary, secondary, and below-the-limiting current distributions for ring electrodes were computed. The ring-disk system was modeled for secondary and below-the-limiting current distributions. Mass transfer measurements in laminar, transition, and turbulent flows were made for thin rotating rings. The effect of cell walls on the potential distribution of disk electrodes was computed. (ERA citation 06:023987)

Interactions of Molecules with Surfaces. Progress Report, 1 May 1980-31 March 1981.
E. F. Greene. Mar 81, 11p COO-4974-3
Contract AS02-78ER04974

An improved apparatus has been designed and constructed to measure the angular distribution of rare gas atoms scattered elastically, or nearly elastically, from the surfaces of crystals. The yields of ions produced when neutral beams of Li, Na, K and Tl hit surfaces of Si (III) or Pt are recorded as they vary with the temperatures of the surfaces. The ions are identified by mass spectroscopy and the surface cleanliness monitored by Auger measurements. Reactions can be activated when fast beams of molecules hit a stationary surface. Above a threshold in kinetic energy beams of W(CO) sub 6 leave a nonvolatile deposit of decomposition products on a glass surface. Raman spectra of these deposits show bands in the carbonyl and metal-carbon stretching regions. Similar experiments with beams of paraldehyde show it decomposes to acetaldehyde in one energetic collision. (ERA citation 06:022772)

Theoretical Study of Electron Capture in Ion-Ion and Ion-Atom Collisions. Progress Report, September 1, 1980-April 30, 1981.
M. Lieber, and F. T. Chan. Apr 81, 104p
Contract AS05-80ER10749

The eikonal approximation has been recently shown to be of significant utility in the study of electron capture cross sections for energetic ion-atom collisions. The method generally gives much better agreement with available experimental data than does the simple OBK approximation without substantially increasing the difficulty of computation. In the present work, the total cross section is computed for electron capture into an arbitrary nl subshell of H exp + , C exp +6 , O exp +8 , and Fe exp +24 ions from ground state hydrogen atoms, at energies of 40 to 200 keV/nuclear (30 to 100 keV in the H exp + case). These species were selected because of their importance in fusion studies. Interesting variations with l were obtained. Cross sections for capture into an arbitrary final n-shell, or into all final bound states were also obtained. An analytical closed form expression is derived for electron capture from an arbitrary initial nlm state to an arbitrary final n'l'm' state of a hydrogenic target. Numerical results are presented for all n' = 2,3 final states in hydrogen, which may be subjected to experimental test in the near future. Extension of the eikonal method to multielectron targets was studied. There are ambiguities in the method requiring further analysis. Agreement with experimental data is nevertheless satisfactory, but the high energy results are suspect. (ERA citation 06:022773)

Measurement of Pair Interactions in Neodymium Ethyl Sulfate.
A. R. King, and C. D. Jeffries. Aug 70, 23p
Contract AT03-76EV72005

The EPR spectrum of single ions of exp 143 Nd in a crystal of Neodymium Ethyl Sulfate, predominantly of isotope exp 142 Nd, was observed under condition of very high Boltzmann factor, i.e., high fields and low temperatures. It was found that the interactions with neighboring ions displaced the hyperfine lines from uniform spacing, and that by measuring the deviation it was possible to find the nearest neighbor interaction. The departure from a purely magnetic dipolar interaction is smaller than previous measurements would indicate. It was found that EPR resonance at large values of H/T in magnetically concentrated crystals can yield accurate values of spin-spin interactions. (ERA citation 06:022774)

Self-Focusing in SF sub 6.
J. R. Ackerhalt, and H. W. Galbraith. 1981, 7p
CONF-810429-15
Contract W-7405-ENG-36
Conference on optics, Santa Fe, NM, USA, 6 Apr 1981.

It is shown by explicit calculation of previously published quasicontinuum model that the molecular susceptibility rapidly approaches zero as higher excited states of the molecule become populated. Hence the overtones of the nu sub 3 -pumped mode are totally responsible for the self focusing effects in SF sub 6 . The nu sub 3 ladder contribution to the susceptibility is calculated. The vibrational model is a classical triply degenerate anharmonic oscillator in the Cartesian basis with the anharmonicity parameters chosen to be consistent with the latest spectroscopic analysis of the 3 nu sub 3 overtone spectrum. The rotational structure is represented by a distribution of these oscillators where the distribution is chosen to correspond to the spectrum of the nu sub 3 fundamental. Good agreement is found with the 300 exp 0 in self-focusing data of Nowak and Ham at CO sub 2 P(28), P(20) and P(10) in SF sub 6 . (ERA citation 06:022775)

Role of Black Carbon in the Organic Chemistry of Atmospheric Aerosols.
L. A. Gundel, R. L. Dod, A. D. A. Hansen, H. Rosen, and S. G. Chang. Apr 81, 7p CONF-810475-2
Contract W-7405-ENG-48
Workshop on physics and chemistry of energy-related atmospheric pollution, Harper's Ferry, WV, USA, 21 Apr 1981.

Black carbon plays a significant role in the physics and chemistry of atmospheric aerosols because of its optical absorptivity, adsorption capacity, and surface characteristics. These properties affect the composition and chemical behavior of the associated organic material. Gas chromatographic and mass spectral studies indicate that particulate organic material contains unburned and partially oxidized fuel hydrocarbons, polynuclear aromatic hydrocarbons, and polyfunctional oxygenated compounds which may be formed in the atmosphere by reactions of hydrocarbons with atmospheric or pollutant gases. Carbonaceous aerosols were characterized using combustion evolved gas analysis (thermal analysis) with simultaneous optical attenuation measurements and selective solvent extraction. Thermograms of urban aerosols typically exhibit three broad peaks when evolved CO sub 2 concentration is plotted versus heating temperature. Sample thermograms are shown. Field and characterization studies indicate that the ratios of secondary to primary carbon in urban particulate matter are similar for samples collected in Berkeley, Los Angeles, and New York City, irrespective of the level of photochemical activity at the sampling sites. The fraction of black carbon to total carbon in urban carbonaceous particles is approximately constant, independent of sampling location or time of year. (ERA citation 06:022532)

The Lewis Chemical Equilibrium Program with Parametric Study Capability.
R. Sevigny. May 81, 287p NASA-CR-161811
Contract NAS8-31640

The program was developed to determine chemical equilibrium in complex systems. Using a free energy minimization technique, the program permits calculations such as: chemical equilibrium for assigned thermodynamic states; theoretical rocket performance for both equilibrium and frozen compositions during expansion; incident and reflected shock properties; and Chapman-Jouget detonation properties. It is shown that the same program can handle solid coal in an entrained flow coal gasification problem.

N81-26276/8 PC **A12**/MF **A01**
Computer Sciences Corp., El Segundo, CA.
Addition to the Lewis Chemical Equilibrium Program to Allow Computation from Coal Composition Data.
R. Sevigny. Dec 80, 271p NASA-CR-161809
Contract NAS8-31640

Changes made to the Coal Gasification Project are reported. The program was developed by equilibrium combustion in rocket engines. It can be applied directly to the entrained flow coal gasification process. The particular problem addressed is the reduction of the coal data into a form suitable to the program, since the manual process is involved and error prone. A similar problem in relating the normal output of the program to parameters meaningful to the coal gasification process is also addressed.

Solid Waste: Methodology for Evaluation. Volume I: Tests for Potential Mobility of Toxic Components as Leachates,
M. M. McKown, J. S. Warner, R. M. Riggin, M. P. Miller, and R. E. Heffelfinger. Jan 81, 136p
Contract EPA-68-03-2552
See also Volume 2, PB81-214918.

Battelle Columbus Laboratories conducted this research program to develop a method for assessing potential mobility of organic compounds from a waste codisposed in a municipal landfill. Inorganic constituents were monitored to provide a basis for comparison with previous research in the field using distilled water, 0.5 N acetic acid titration (extraction procedure-EP), and other leaching media. A literature survey and contacts with key scientists served as the basis for assessing state-of-the-art leachate research. A quality assurance study to assess the precision and accuracy of analytical methods to be used to evaluate the leachates and wastes was conducted prior to initiation of leachate research. An interlaboratory comparison study of potential mobility procedure developed by Battelle and the total content method developed by Southern Research Institute (SoRI) was performed jointly by both laboratories. The ink pigment and still bottoms wastes were used for the interlaboratory comparison of the methods. The advantages and disadvantages of the various analytical methods used throughout the program to determine metals and organics are discussed in detail. It was concluded that the leaching procedure and analytical methods used meet all of the

original objectives of the program including feasibility of implementation at a cost of under $1850 per sample.

Hydrogen Spillover on Alumina--A Study by Infrared Spectroscopy.
Final rept.,
R. R. Cavanagh, and J. T. Yates. 1981, 5p
Pub. in Jnl. of Catalysis 68, p22-26 1981.

Infrared spectroscopy has been used to monitor the exchange of D2 (g) with OH groups chemisorbed on Al2O3. It has been shown that near 300K, the rate of the exchange process is rapid in the presence of supported Rh particles on the Al2O3. A qualitative model for hydrogen 'spillover' is presented in which dissociative adsorption of dihydrogen by the metal is a key step. It is shown that CO chemisorption on the supported Rh leads to a marked reduction in the 'spillover' rate due to site blockage on the Rh. This is consistent with recent studes of behavior of the CO and H coadsorbed on Rh (111).

The Dielectric Constant of SF6 Near the Critical Point.
Final rept.,
B. J. Thijsse. 15 Apr 81, 15p
Sponsored in part by National Aeronautics and Space Administration, Washington, DC.
Pub. in Jnl. of Chemical Physics 74, n8 p4678-4692, 15 Apr 81.

Measurements are reported of the dielectric constant of SF6 at the critical density (+ or - %) over a temperture range of - .001 less than (T-T(c))/T(c) less than + . 01 The experimental cell was especially designed to suppress spurious effects resulting from temperature gradients and gravity. Temperature stability was better than + or - 20 muK and capacitance stability better than 0.5 ppm over several days. The critical temperature was determined as 318.718 + or - 0.002 K and was completely free of drift. Capacitance data were reproduced within a few ppm over the duration of the experiment. No direct evidence of ε (T-T(c))sup(1-a) anomaly was found; an upper bound of 5ppm is established. Effects of fluid stratification and phase separation were clearly seen and are well understood. We find a value of 0.325 + or - 0.005 for the critical exponent beta.

Extraction and Analysis of Adenosine Triphosphate from Aquatic Environments.
Water-resources investigations,
Doyle W. Stephens, and David J. Shultz. Apr 81, 35p USGS/WRD/WRI-81/049, USGS/WRI-81/5

A variety of adenosine triphosphate (ATP) extraction procedures have been investigated for their applicability to samples from aquatic environments. The cold sulfuric-oxalic acid procedure was best suited to samples consisting of water, periphyton, and sediments. Due to cation and fulvic acid interferences, a spike with a known quantity of ATP was necessary to estimate losses when sediments were extracted. Variable colonization densities for periphyton required that several replicates be extracted to characterize accurately the periphyton community. Extracted samples were stable at room temperature for one to five hours, depending on the ATP concentration, if the ph was below 2. Neutralized samples which were quick frozen and stored at -30C were stable.

Proceedings of the European Symposium on Physico-Chemical Behaviour of Atmospheric Pollutants (1st) Held at Ispra Establishment, Italy on 16-18 October 1979,
B. Versino, and H. Ott. c1980, 529p EUR-6621-DE-EN-FR
Prepared in cooperation with Joint Research Centre, Ispra Establishment (Italy).
Customers in the European Community Countries should apply to the office for official publications of the European Communities, B. P. 1003, Luxembourg.

The first European Symposium 'Physico-chemical behaviour of atmospheric pollutants' has been organized by the Commission of the European Communities within the framework of a Concerted Action executed under the same title, known also under the code 'COST Project 61a', as a part of the Communities' research activities in the environmental field. With the aid of a 'concerted Action Committee' composed of delegates and expert from the participating countries, some 150 ongoing relevant research projects were identified, including research done in the Communities' own Joint Research Center. Five working parties were set up, covering the following aspects of the conversion of atmospheric pollutants: Detection, identification and analysis of pollutants; Chemical and photochemical reactions, mechanisms and rates; Aerosol characterization and particle formation; Pollutant cycles (sources and sinks); Transport and modelling. An Evaluation of the Hewlett-Packard 5993B Gas Chromatograph-Mass Spectrometer,
Denis L. Foerst. Jun 81, 53p EPA-600/4-81-043

This report gives the results of an evaluation of a Hewlett-Packard Model 5993B computerized gas chromatograph/mass spectrometer. The evaluation was done according to the procedures found in EPA research report number EPA-600/4-80-025, 'Performance Tests for the Evaluation of Computerized Gas Chromatography/Mass Spectrometry Equipment and Laboratories.' Changes in the 'Performance Test' specifications for the BFB spectrum validation test have been made and are noted in the results for Tests 1 and 8. The system performed satisfactorily during the evaluation and is acceptable for the analyses of organic compound using methods similar to EPA Methods 624 and 625. The HP-5993B system produced valid mass spectra, exhibited good to excellent stability, and gave a satisfactory detection limit. The precision and accuracy for external or internal quantitation using direct sample injection or purge and trap were excellent. Both 14 AMU and PBS mass spectral library searches were accurate; however, the search times using the PBS library search were longer than the requirements 'Performance Tests'. Some problems, particularly with brominated compounds, were discovered during this evaluation. The manufacturer corrected the instrument to alleviate these problems.

Current Research at NBS Using Synchrotron Radiation at SURF-II.
Final rept.,
A. C. Parr, G. Rakowsky, D. L. Ederer, and R. L. Stockbauer. Apr 81, 5p

Sponsored in part by Department of Energy, Washington, DC., and Office of Naval Research, Washington, DC.
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science NS-28, n2 p1210-1214 Apr 81.

The National Bureau of Standards (NBS) Synchrotron Ultraviolet Radiation Facility (SURF-II) is used in conjunction with a high flux normal incidence monochromator for angle resolved wavelength dependent photoelectron studies. The recent work has concentrated on studies of the effect of shape resonances on molecular vibrational intensity distributions as well as the effects of autoionization upon the vibrational intensity distributions over narrow wavelength regions. Results for CO, N2, Ar and Xe will be discussed.

Manual of Analytical Quality Control for Pesticides and Related Compounds in Human and Environmental Samples,
Joseph Sherma. Apr 81, 468p EPA-600/2-81-059
Contract EPA-68-02-2474
See also Jan 79, PB-298 711.

This manual provides the pesticide chemist with a systematic protocol for the quality control of analytical procedures and the problems that arise in the analysis of human or environmental media. It also serves as a guide to the latest and most reliable methodology available for the analysis of pesticide residues in these and other sample matrices. The sections dealing with inter- and intra-laboratory quality control, the evaluation and standardization of materials used, and the operation of the gas chromatograph are intended to highlight and provide advice in dealing with many problems which constantly plague the pesticide analytical chemist. Many aspects of the problem areas involved in extraction and isolation techniques for pesticides in various types of samples are discussed. Techniques for confirming the presence or absence of pesticides in sample materials are treated at some length. This highly important area provides validation of data obtained by the more routine analytical procedures. The gas chromatograph, being the principal instrument currently used in pesticide analysis, often requires simple servicing or troubleshooting. A section addressing some of these problems is included. Last, but by no means least in importance, is a short dissertation of the value and need for systematic training programs for pesticide chemists.

Review of Experimental Methods for Determining Effective Diffusivities in Catalyst Pellets,
D. S. Van Vuuren. Mar 80, 33p CSIR-SR-CENG-319

The steady state Wicke-Kallenbach method is preferred for the determination of gas phase diffusivities, but is unsuitable for work in the liquid phase. For the latter transient methods should be used. Stirred tank methods are normally used for multiple pellet work and pulse liquid chromatography may provide a suitable alternative. For single pellets the continuous stirred tank method and the closed chamber Wicke-Kallenbach method are the most promising.

Tricyclic Diterpenoids of the Dolastane Ring System from the Marine Alga 'Dictyota divaricata',
H. H. Sun, O. J. McConnell, William Fenical, Ken Hirotsu, and Jon Clardy. c1981, 7p NOAA-81042707
Grant NOAA-04-7-158-44121
Pub. in Tetrahedron, v37 p1237-1242 1981. Prepared in cooperation with Cornell Univ., Ithaca. Dept. of chemistry.

Four new oxygenated tricyclic diterpenoids have been isolated from the Caribbean brown alga Dictyota divaricata. The structures of these new compounds were secured by an X-ray analysis of a convenient diol derivative, followed by interconversion where possible. The new diterpenoids belong to the dolastane group first isolated from the herbivorous mollusc Dolabella auricularia, and their isolation here indicates that the sea hare most likely derived these compounds from brown seaweeds of the family Dictyotaceae. Molecular Resonance Phenomena.
A. U. Hazi. 1980, 17p CONF-8005162-1
Contract W-7405-ENG-48
Workshop on electron-atom and electron-molecule collisions, Bielefeld, F.R. Germany, 5 May 1980.

It is attempted to show that the Stieltjes-moment-theory provides a practical and a reasonably accurate method for calculating the widths of molecular resonances. The method seems to possess a number of advantages for molecular applications, since it avoids the explicit construction of continuum wavefunctions. It is very simple to implement the technique numerically, because it requires only existing bound-state electronic structure codes. Through the use of configuration interaction techniques, many-electron correlation and polarization effects can be included in the description of both the resonance and the non-resonant background continuum. To illustrate the utility and the accuracy of the Stieltjes-moment-theory technique, used in conjunction with configuration interaction (CI) wave functions, recent applications to the exp 1 sigma /sub u/(1sigma/sub u/ 2sigma/sub g/) autoionizing resonance state of H sub 2 and the well known exp 2 PI/sub g/ state of N sub 2- are discussed. The choices of the one-electron basis sets and the types of many-electron configurations appropriate for these two cases are described. Also, guidelines for the selection of the projection operators defining the resonant and non-resonant subspaces in the case of both Feshbach and shape-resonances are given. The numerical results indicate that the Stieltjes-moment-theory technique, which employs L exp 2 basis functions exclusively, produces as accurate resonance parameters as can be extracted from direct electron-molecule scattering calculations, provided approximately the same approximations are used to describe important physical effects such as target polarization. Furthermore the method provides sufficiently accurate fixed-nuclei electronic resonance parameters to be used in ab initio calculation of resonant vibrational excitation cross sections. Ichthyoplankton data from the files of the Sandy Hook Marine Laboratory are summarized from collections in the Middle Atlantic Bight between 1965 and 1976. The data are compiled from plankton samples collected on coastal surveys designed to monitor seasonal shifts in the distribution and abundance of planktonic fishes, and from site-specific studies designed to investigate the vertical distribution and diel movements of larvae representing selected species. The report describes occurrences and seasonal patterns of distribution of larvae for the numerically dominant species collected on the 13-month R/V Dolphin survey in 1965-66; a 15-month survey of the New York Bight from 1974 to 1976; and semi-annual surveys from Cape Hatteras to Martha's Vineyard from 1973 to 1976.

Contract DI-AA550-IA7-35

The study analyzed benthic grab samples from two sites in the Baltimore Canyon Trough. Surficial sediments were basically medium to fine sands; heavy metal (Cd, Cr, Ni, Pb, Zn) concentrations were low or undetectable; and the benthic infauna were dominated by polychaetes and peracarid crustaceans. An assessment of possible impacts from oil-related activities on the benthos was also made.

Regional Variation in the Size of Maturity of Two Species of Tanner Crab (Chionoecetes bairdi and C. opilio) in the Eastern Bering Sea, and Its Use in Defining Management Subareas,
David A. Somerton. 1981, 15p CONTRIB-538, NOAA-81042919
Pub. in Canadian Jnl. of Fisheries and Aquatic Sciences, v38 n2 p163-174, 1981.

Minimum size limits for the commercial harvest of tanner crab (Chionoecetes bairdi and C. opilio) are based on the sizes of sexual maturity. Establishing such size limits in the eastern Berging Sea is complicated by a large regional variation in the size of maturity. A computer technique was developed which partitioned the eastern Bering Sea into subareas that were relatively homogeneous with respect to the size of maturity.

Distributions of Surficial Sediment and Eelgrass in Great South Bay, New York (from Smith Point, West to Wantagh State Parkway),
Clifford R. Jones, and J. R. Schubel. Sep 80, 42p SR-39, REF-80-6, NOAA-81042912
Prepared in cooperation with Long Island Regional Planning Board, NY.

Great South Bay is a bar-built estuary located along the south shore of Long Island. It is shallow and receives runoff from more than forty streams and rivers. In addition to being a seasonal recreational area, Great South Bay is noted for its tremendous harvest of hard clams and also has many varieties of finfish that support commercial and recreational fisheries. With increases in population along the shorelines, stresses on the bay have increased. The amounts of pollutants added to streams have intensified. Since many of these, including most metals and chlorinated hydrocarbons, are relatively insoluble in water, they are scavenged rapidly from solution near their points of introduction by suspended particulate matter. Many end up on the bottom of Great South Bay in channels and other areas where fine-grained sediments are accumulating. The objectives of this study were to map the texture of the surficial sediments, their organic content, and the distribution of eelgrass.

Biological Effects of Sand and Gravel Mining in the Lower Bay of New York Harbor: An Assessment from the Literature,
B. H. Brinkhuis. Jan 80, 205p SR-34, REF-80-1, NOAA-81043002

An assessment of potential biological effects of sand and gravel mining in the Lower Bay Complex of New York Harbor is made from the currently available literature concerning distribution and abundance of organisms in the Lower Bay Complex in relation to what is known about effects associated with sand and gravel mining/dredging operations. In particular, the effects of suspended sediments on various organisms are examined. The assessment encompasses suspended sediment effects on benthic infauna (e.g., shellfishes, worms, and other burrowing animals) and epibenthic fauna, including amphipods, crustacea, and demersal fishes. Other effects associated with mining/dredging operations, e.g., release of contaminants and nutrients from sediments are also examined.

Antennae-Whipping Behavior in the American Lobster, 'Homarus americanus' (Milne-Edwards),
Michael H. Solon, and J. Stanley Cobb. c1980, 12p MARINE REPRINT-126, NOAA-81042904
Grant NA79AA-D-00096
Pub. in Jnl. of Experimental Marine Biology and Ecology, v48 p217-224 1980.

Electrophysiological techniques were employed to demonstrate that an acrylic coating blocks the mechanosensory activity of the cuticular hair organs on the chelipeds of Homarus americanus (Milne-Edwards) without eliciting spurious activity in their innervation. Agonistic encounters between animals with acrylic on the dorsal surface of the claws (experimental), on the ventral surface of the claws ('plastic' control), and absent ('bare' control) were observed. Experimental animals responded to less than 3% of all antennae-whips, while 'plastic' control animals responded to 73% and 'bare' control animals to 64% of all antennae-whips. The authors conclude that antennae-whipping is a form of tactile communication, in which information probably is received through mechanosensory activity in the cuticular hair organs on the dorsal surface of the chelipeds.

The External Morphology and Distribution of Cuticular Hair Organs on the Claws of the American Lobster, 'Homarus americanus' (Milne-Edwards),
Michael H. Solon, and J. Stanley Cobb. c1980, 15p MARINE REPRINT-125, NOAA-81042903
Grant NA79AA-D-00096
Pub. in Jnl. of Experimental Marine Biology and Ecology, v48 p205-215 1980.

Four classes of microscopic cuticular hair organs were found on the chelae of Homarus americanus (Milne-Edwards). Type I and Type II organs possess long single sensillae, 30-60 micro m and 70-130 micro m, respectively. Type III organs are toroid bumps 20-30 micro m in diameter, with a small tuft of fibers projecting from the center. Type IV organs are small conical hairs approximately 1 micro m in length. Type IV organs were uniformly distributed over the claws. The distributions of Types I, II, and III organs were analysed through multivariate analysis of variance (MANOVA) with respect to claw, side, and area. Type I organs showed significance of the three-way interaction only. Type II organs showed significance of side, area, and the claw by area interaction. Type III organs showed significance of area, and all interactions. Changes in number and density of Types I, II, and III organs, and in the number of Type IV organs, were found with growth.

Polyploidy Induced in the American Oyster, 'Crassostrea virginica', with Cytochalasin B,
Jon G. Stanley, Standish K. Allen, Jr., and Herbert Hidu. c1981, 11p NOAA-81050801
Grant NOAA-04 7-158-44034
Pub. in Aquaculture, v23 p1-10 1981.

Polyploidy was induced in the American oyster by treating the zygote with cytochalasin B. In treatments begun at 50 min after fertilization and lasting 20 min, 13 of 22 oysters treated with 0.1 mb/l cytochalasin and 3 of 4 treated with 1.0 mg/l were polyploid. In treatments with 0.5 mg/l, cytochalasin given from 0 to 15 min after fertilization resulted in 10 polyploids out of 20 and, from 15 to 30 min, 34 ploypoids out of 46 examined. Juvenile oysters had about the same percentage of polyploid individuals as embryos. Only triploids were seen at 8 months, whereas triploids and tetraploids were observed in embryos. Oysters developed from treated zygotes set normally and subsequent survival was indistinguishable from those of controls. At 8 months the control and treated oysters both averaged 13 mm in shell height. Survival at 24 h was about 33% that of controls for the 0.1 mg/l treatment and 15% for the 1.0 mg/l treatment. Survival was greater for oysters treated for 15 min beginning immediately after fertilization than if treatment began later at 15 or 40 min.

D. G. Aubrey. May 81, 61p WHOI-81-28, ARO-16710.1-GS
Contract DAAG29-81-K-0004, Grant NA79AA-D-00102
Sponsored in part by Grant NA80AA-D-00077.

A directional wave gage consisting of a two-axis electromagnetic current meter and a pressure sensor, developed by Sea Data Corporation, with modifications specified by the author, was successfully deployed during the joint NOAA/U.S. Army Corps of Engineers Coastal Engineering Research Center's Atlantic Remote Sensing Land/Ocean Experiment (ARSLOE) during November, 1980. Data recovery rate was 100%, and instrument function was verified through comparison with a four-element pressure sensor array at the same location, an X-band imaging radar, and with surface meteorological observations charting developing local wave fields. The instrument was proven to be a viable alternative for point measurements of directional wave fields and for estimating the first five fourier coefficients in a directional wave model. (Author)

Plane Tidal Waves Generated by an Array of Simultaneous Underwater Explosions.
Master's Thesis,
Henry James Weber. Mar 81, 45p Rept no. AFIT/GNE/PH/81M-11

This report considers an array of simultaneous underwater nuclear explosions generating plane tidal waves on the continental shelf. Computer simula-

tions are used to study this wave generation process. They are based on non-linear shallow water theory with an initial condition of a stationary raised cone of water. The sensitivity of the wave height to different yields, combination of different yields, spacing, alignment, timing, and bottom slope is determined. The reference values used for this study are a yield of five kilotons TNT, one kilometer spacing, water depth of 100 meters, and no bottom slope. In addition to the sensitivities, the amount of non-linear effect is illustrated by comparison of wave contour printer-plots generated by linear and non-linear shallow water theory. The computer results indicate the wave generation is relatively insensitive to realistic variations in the parameters. (Author)

Wave Propagation Over Rectangular Trench.
Preprint,
J. J. Lee, and R. M. Ayer. Dec 80, 17p NSF/RA-800544
Grant NSF-ENV77-01599

An analysis is presented for the propagation of water waves past a rectangular submarine trench. Two-dimensional, linearized potential flow is assumed. The fluid domain is divided into two regions along the mouth of the trench. Solutions in each region are expressed in terms of the unknown normal derivative of the potential function along this common boundary with the final solution obtained by matching. Reflection and transmission coefficients are found for various submarine geometries. The result shows that for a particular flow configuration, there exists an infinite number of discrete wave frequencies at which waves are completely transmitted. The validity of the solution in the infinite constant water depth region is shown by comparing with the results using a boundary integral method for given velocity distributions along the mouth of the trench. The accuracy of the matching procedure is also demonstrated through the results of the boundary integral technique. In addition, laboratory experiments were performed and are compared with the theory for two of the cases considered.

The effects of wind flow and thermal gradients on the flow of equatorial currents are considered. Both vertical and horizontal gradients are included, as is the additional effect of wave generation. The hydrodynamics of equatorial undercurrents are also considered. (Contains 60 citations fully indexed and including a title list.)

Principal Facts, Accuracies, Sources, Base Station Descriptions, and Plots for 1380 Gravity Stations in the Tonopah 1 deg by 2 deg Quadrangle, Nevada.
Final rept.,
R. W. Saltus, D. B. Snyder, and C. R. Karish. 1981, 89p USGS/GD-81/004
Prepared in cooperation with Department of Energy, Las Vegas, NV. Nevada Operations Office.

The principal facts contained in the tables of this report document 1380 gravity stations on the Tonopah 1 degree x 2 degree quadrangle, Nevada. Base station descriptions, location plots, and observed gravity base station values further describe these stations. All the stations have been reduced to complete Bouguer anomalis. Three sources provided original field measurements: the U.S. Geological Survey, Menlo Park; the Defense Mapping Agency/Topographic Center/Geodetic Survey Squadron; and the U. S. Geological Survey, Denver. Each source is documented as to meters used, calibration, and field terrain correction method.

Geologic and Geophysical Investigations of the Zuni-Bandera Volcanic Field, New Mexico.
M. E. Ander, G. Heiken, J. Eichelberger, A. W. Laughlin, and S. Huestis. May 81, 41p LA-8827-MS
Contract W-7405-ENG-36
Microfiche only after original copies are exhausted.

A positive, northeast-trending gravity anomaly, 90 km long and 30 km wide, extends southwest from the Zuni uplift, New Mexico. The Zuni-Bandera volcanic field, an alignment of 74 basaltic vents, is parallel to the eastern edge of the anomaly. Lavas display a bimodal distribution of tholeiitic and alkalic compositions, and were erupted over a period from 4 Myr to present. A residual gravity profile taken perpendicular to the major axis of the anomaly was analyzed using linear programming and ideal body theory to obtain bounds on the density contrast, depth, and minimum thickness of the gravity body. Two-dimensionality was assumed. The limiting case where the anomalous body reaches the surface gives 0.1 g/cm exp 3 as the greatest lower bound on the maximum density contrast. If 0.4 g/cm exp 3 is taken as the geologically reasonable upper limit on the maximum density contrast, the least upper bound on the depth of burial is 3.5 km and minimum thickness is 2 km. A shallow mafic intrusion, emplaced sometime before Laramide deformation, is proposed to account for the positive gravity anomaly. Analysis of a magnetotelluric survey suggests that the intrusion is not due to recent basaltic magma associated with the Zuni-Bandera volcanic field. This large basement structure has controlled the development of the volcanic field; vent orientations have changed somewhat through time, but the trend of the volcanic chain followed the edge of the basement structure. It has also exhibited some control

on deformation of the sedimentary section. (ERA citation 06:023388)

Using Presence of Calcite Cap Rock in Shales to Predict Occurrence of Reservoirs Composed of Leached Secondary Porosity in the Geopressured Zone. Annual Report, June 1, 1980-October 31, 1980.
W. R. Kaiser, K. Magara, K. L. Milliken, and D. L. Richmann. Jan 81, 36p
Contract AC08-79ET27111

The distribution of high-resistivity shale in the Frio Formation between hydropressured and geopressured strata has been mapped along the Texas Gulf Coast. Two high-resistivity intervals more than 1000 ft thick have been mapped, one in Brazoria and Galveston Counties and the other in Kenedy County. They coincide with Frio delta systems and may be related to extraordinary quantities of CO sub 2 produced by deltaic sediments rich in woody and herbaceous matter. Beyond being calcareous, the nature of the high-resistivity interval is enigmatic and its relationship to deep secondary porosity problematic. Most of the contained carbonate is microscopically and isotopically skeletal in origin, revealing no evidence of diagenetic modification. Minor rhombs of iron-bearing carbonate tens of microns in size were identified. Detrital feldspar compositions are being established to test subsequent changes in feldspar composition resulting from progressive burial and albitization. Hydrolysis reactions for authigenic minerals and reactions between key pairs of minerals have been written. Thermodynamic functions for complex phyllosilicates at temperatures up to 200 exp 0 C have been calculated. From thermodynamic calculations it was predicted that ferroan calcite would be the favored authigenic carbonate in shales. (ERA citation 06:021958)

Structure of the Presidio Bolson Area, Texas, Interpreted from Gravity Data.
J. R. Mraz, and G. R. Keller. 1980, 23p
Contract AS05-76ET28388

To obtain a better understanding of the structure and tectonism of the region, an integrated geophysical-geological study of the Presidio area, Texas, was undertaken using gravity measurements and deep drilling data. New gravity data were combined with existing data to construct simple Bouguer anomaly maps of the Presidio area, and two-dimensional computer modeling of gravity profiles was used to derive earth models. These data outline the major geologic features of the area that are dominated by the effects of Tertiary block faulting and volcanism. The main feature of interest was the Presidio Graben, which is approximately 1.5 km deep near Ruidosa, Texas. One motivation for this study was the collection of a part of the basic scientific data needed to assess the geothermal potential of the area, and the results obtained support the hypothesis that hot springs associated with the Presidio Graben derive their heat from deep circulation along its boundary faults. However, some gravity anomalies observed could be interpreted as indicating the presence of late Tertiary intrusions that could provide heat for the hot springs. (ERA citation 06:021959)

Clay Mineralogy of Selected Sediments and Soils at the Savannah River Plant, Aiken, South Carolina.
R. V. Ruhe, and E. A. Matney. 1979, 59p
Contract AC09-76SR00001

Six samples of stream and pond sediments, six soil samples, one sample of sluiced fly ash, and one sample of precipitated coal ash from the Savannah River Plant were selected for clay-mineral studies. Among the sediments and soils, only one sample contained kaolinite, illite, and a 14 A mineral which expanded after glycolation and collapsed after heating. All other sediments and soils contained only kaolinite and a 14 A mineral which did not expand after glycolation and which collapsed progressively toward 10 A at successively higher temperature heating. The percentages of clay minerals were estimated by using the recently developed method of adding increasing proportions of soil clay to a constant standard. All sediments and soils were acidic, had low cation-exchange capacities, and were deficient in extractable bases. They were derived from or were part of Ultisols, which are rather severely weathered soils. The fly and coal ash were essentially composed of minerals of low- and high-temperature quartz and a fired product of alumina-silica (mullite). The x-ray analyses were verified by elemental chemical analyses by using inductively coupled plasma-optical emission spectrometry. (ERA citation 06:022729)

Geophysical Examination of Coal Deposits.
L. J. Jackson. Apr 81, 116p
U.S. Sales Only.

In recent years, the coal industry has focussed its attention on geophysical techniques in the solution of mining problems and as an aid to mine planning. One important application of geophysics is in the various techniques of geophysical borehole logging. Since there are large contrasts in physical properties between coal and the other rocks normally found in a coal deposit, the responses of the coal seams to logging tools, each measuring a different physical characteristic of the rocks, may be easily recognized on the logging records. Based upon information from the logs, cores for laboratory analysis are only cut from selected sections of the borehole. In addition, information about the density and chemical composition of the coal may be obtained. Another geophysical technique which has been used with great success in coal deposits is seismic surveying. Surface seismic reflection surveys using two-dimensional arrays of seismic sources and detectors have been found in areas of simple geology to be capable of detecting faults with throws as small as 3 m at depths of 800 m. In geologically disturbed areas, good results have been obtained from three-dimensional surveys. Still smaller faults as far as 500 m in advance of the working face may be detected using in-seam seismic surveying conducted from a roadway or working face. Small disturbances have also been detected successfully by pulse radar and continuous wave electromagnetic methods either from within boreholes or from underground. The range of these techniques is at present smaller than that of the seismic techniques. Other geophysical techniques which exploit the electrical, magnetic, gravitational, and geothermal properties of rocks have been found capable of locating abandoned mine shafts and other subsurface cavities at old mining sites and of delineating areas of clinkered rocks. Large-Volume Tests in Rock Mechanics.
D. J. Watkins, and R. K. Thorpe. Apr 81, 14p
CONF-810559-1
Contract W-7405-ENG-48
Conference on properties of materials under extreme conditions, Los Alamos, NM, USA, 18 May 1981.

Few laboratory tests have been performed on rock specimens with principal dimensions in excess of 30 cm. While available data have shown that sample size can have a major influence on measured properties, the magnitude of these effects remains uncertain. Interpretation of laboratory data is further complicated by the effects of sample disturbance, stress relief, and the inability to fully reproduce in situ boundary conditions. In situ methods of testing enable more representative volumes of a rock mass to be studied in a relatively undisturbed state, but are limited by uncertainties of boundary conditions and the inability to reproduce generalized stress conditions. For engineering design, rock mass properties must be estimated by synthesis of data from a variety of laboratory and in situ testing procedures, rock mass classification, and fracture characterization techniques. An experimental program to study the strength and permeability of a 1.0m diameter by 2.0m high specimen of granitic rock provides an example of large volume laboratory tests. This sample failed in unconfined axial stress was increased from zero to 5.56 Mpa, the permeability of the specimen decreased from 5.25cm/sec to 0.5cm/sec, but then increased to some 2.0cm/sec due to shear dilatancy and fracture opening associated with failure of the sample. A New Classification of Mineral Resources of the Sea,
Erqin Zhu. 14 May 79, 5p
Included in Kexue Tongbao, v25 n2 p168-172 Feb 80.

It has been some 300 years since man began surveying and exploiting subsea mineral resources. In recent years much research and exploration has been done for the extraction of deep sea manganese nodules, and further, the exploitation of the mineral resources of deep ocean floors on a big scale has also been considered. The magmatism of ocean ridge is favorable for mineralization so through many years of marine geological work, there have been found wide spread phenomena of mineralization, numerous outcrops of pay mother rock, rare pay sediment, and non-existent ore deposits of bed rock under ocean floor. The further object in this field will be the prospecting and exploiting of endogenic metallic mineral resources beneath deep ocean floors.

A Technique for Evaluating the Hydraulic Conductivity of Saprolite,
Charles W. Welby. Apr 81, 46p UNC-WRRI-81-164, W81-03605, OWRT-A-115-NC(1)
Contract DI-14-34-0001-1135

Increased emphasis on stringent controls of solid/hazardous wastes burial sites and the need in North Carolina for a rapid cost-effective evaluation of potential sites for such purpose required a quick, reasonably accurate method for determining hydraulic conductivity (HC) of saprolite developed on the crystalline rocks of the Piedmont Province. Development of such a method is reported using adapted commercially-available flow meter as a field instrument, tested with artificial standards composed of Portland cement and sand mixtures in various ratios. The standards related instrument-measured air permeability to HC of standard/field samples encased in heat-shrinkable plastic. Saprolites were studied (250 cores) from various rock types.

The Volume of Sand and Gravel Resources in the Lower Bay of New York Harbor,
H. J. Bokuniewicz, and C. T. Fray. Dec 79, 41p
SR-32, REF-79-16, NOAA-81043001

The shallow (less than 100 ft) stratigraphy of the Lower Bay floor was investigated in order to estimate the volume of sand and gravel deposits under the Lower Bay. Four types of information were studied. These were: (1) core and boring logs, (2) seismic reflection profiles, (3) the surficial sediment distribution on the floor of the Lower Bay,

(4) the stratigraphy in Long Island, Staten Island, northern New Jersey, and the New York Bight. In general, marine sands overlie glacial outwash sands which, in turn, overlie unconsolidated Cretaceous sediments. Along the margins of the Bay, sands are known to rest on fine-grained deposits at depth; the composition of layers underlying the surficial sand deposits in the central and eastern Bay is unknown.

Elastic-Plastic Deformation of Anhydrite and Polyhalite as Determined from Quasi-Static Triaxial Compression Tests.
T. W. Pfiefle, and P. E. Senseny. May 81, 130p
Contract AC04-76DP00789

Constant stress-rate triaxial compression experiments were performed on specimens of anhydrite and polyhalite at low confining pressure and at two temperatures. The loading rate was 5.75 x 10 exp -2 MPa s exp -1 ; the confining pressures were 1, 5, 10, and 20 MPa and the two temperatures were 25 exp 0 C and 100 exp 0 C. The specimens were loaded to failure in a soft testing machine so that failure occurred at peak stress. Results from these experiments were used to construct yield envelopes, failure envelopes and stress-strain curves, and to determine mechanical properties. Yield, determined by the onset of dilatancy, occurs at about sixty percent of peak stress. The effect of temperature on both the yield and failure envelopes is negligible. The polyhalite specimens were found to be about twice as strong as the anhydrite specimens. The stress-strain data were fitted to a constitutive law. (ERA citation 06:022731)

Development of a Universal Water Signature for the Landsat-3 Multispectral Scanner, Part 1.
Final Report, Jan. - Sep. 1980.
E. H. Schlosser. Sep 80, 27p NASA-CR-161012, LEMSCO-15621-PT-1
Contract NAS9-15800

A generalized four channel hyperplane to discriminate water from nonwater was developed using LANDSAT-3 multispectral scaner (MSS) scenes and matching same/next day color infrared aerial photography. The MSS scenes varied in sun elevation angle from 40 to 58 deg. The 28 matching air photo frames contained over 1400 water bodies larger than one surface acre. A preliminary water discriminant, was used to screen the data and eliminate from further consideration all pixels distant from water in MSS spectral space. A linear discriminant was iteratively fitted to the labelled pixels. This discriminant correctly classified 98.7% of the water pixels and 98.6% of the nonwater pixels. The discriminant detected 91.3% of the 414 water bodies over 10 acres in surface area, and misclassified as water 36 groups of contiguous nonwater pixels.

Development of a Universal Water Signature for the Landsat-3 Multispectral Scanner, Part 2 of 2.
Final Report, Jan. - Sep. 1980.
E. H. Schlosser. Sep 80, 220p NASA-CR-161010, LEMSCO-15621-PT-2
Contract NAS9-5800

A generalized four-channel hyperplane to discriminate water from non-water was developed using LANDSAT-3 multispectral scanner (MSS) scences and matching same/next-day color infrared aerial photography. The MSS scenes over upstate New York, eastern Washington, Montana and Louisiana taken between May and October 1978 varied in Sun elevation angle from 40 to 58 degrees. The 28 matching air photo frames selected for analysis contained over 1400 water bodies larger than one surface acre. A preliminary water discriminant was used to screen the data and eliminate from further consideration all pixels distant from water in MSS spectral space. Approximately 1300 pixels, half of them non-edge water pixels and half non-water pixels spectrally close to water, were labelled. A linear discriminant was iteratively fitted to the labelled pixels, giving more weight to those pixels that were difficult to discriminate. This discriminant correctly classified 98.7 percent of the water pixels and 98.6 percent of the non-water pixels.

Hydrogeology of the Buffalo Aquifer, Clay and Wilkin Counties, West-Central Minnesota.
Water-resources investigations,
Ronald J. Wolf. Feb 81, 93p USGS/WRD/WRI-81-041, USGS/WRI-81-4
Prepared in cooperation with Minnesota Dept. of Natural Resources, St. Paul, Clay and Wilkin Counties, and the cities of Moorhead and Sabin.

The Buffalo aquifer is the principal source of ground-water supplies in the Moorhead, Minnesota area. The aquifer is an elongated, narrow deposit of sand and gravel, which locally contains water under confined conditions. Although the Buffalo aquifer contains about 270 billion gallons of water in storage, only 120 billion gallons could be withdrawn. Largest well yields occur along the deep through in the center of the aquifer. Induced streambed infiltration may be possible in certain areas where the stream overlies the aquifer and where the intervening lake sediments are thin or absent. Construction of a numerical model for aquifer evaluation has shown that a considerable amount of ground water is discharged through the confining bed to the stream or leaves the area as underflow to the west.

Influence of Streamflow Reductions on Salmonid Embryo Development and Fry Quality.
Technical completion rept.,
Dudley W. Reiser, and Robert G. White. Mar 81, 159p W81-03606, OWRT-A-058-IDA(1)
Contract DI-14-34-0001-1218
Prepared in cooperation with Idaho Water and Energy Resources Research Inst., Moscow.

The program was designed to examine effects of streamflow reduction on salmonid embryo incubation success, to determine if extragravel parameters could be adequately related to the intergravel environment, and to develop a methodology for recommending embryo incubation flows. Both field and laboratory tests were conducted from 1977-1979. Reductions in streamflow over redds (chinook salmon and steelhead trout) containing sediment (less than 0.84 mm) in quantities from 3-13% resulted in increased embryo mortality. Incubation flow recommendations based on computations using the U.S. Fish and Wildlife Services Instream Flow Group technique should provide for suitable incubation velocities.

Rock Type and Minimum 7-Day/10-Year Flow in Virginia Streams,
Rod W. Smith. Apr 81, 52p VPI-VWRRC-BULL-116, OWRT/A-999-VA(23)
Contract OWRT-A-999-VA
Prepared in cooperation with Patton, Harris, Rust and Guy, Bridgewater, VA.

The purpose of this study was to demonstrate an effective method of minimum 7-day/10-year flow (Q) estimation in order to assist proper construction of sewage treatment plants or to estimate safe surface water withdrawals for water systems. A direct comparable relationship was noted between the geologic rock categories studied and their discharge rate during low flow periods as approximated by Q. Streams flowing through unconsolidated sedimentary material, Triassic sandstone, shale and sandstone interbeds, or metavolcanic rock do not have high yields for their drainage area size; those flowing through metamorphosed sedimentary and igneous rock, Lynchburg conglomerates, and carbonate rock show markedly high flow values relative to their basin size. Springs greatly influence Q stream flow through carbonate rock. Q values can be estimated for streams with dissimilar rock types by addition of streamflows for each rock type within the stream drainage area.

Characterization of Floodflows along the Arkansas River without Regulation by Pueblo Reservoir, Portland to John Martin Reservoir, Southeastern Colorado.
Water-resources investigations (Final),
John R. Little, and Daniel P. Bauer. 1981, 44p USGS/WRI-80-97, USGS/WRD/WRI/81-048
Prepared in cooperation with the Arkansas River Compact Administration and the Southeastern Colorado Water Conservancy District.

The need for a method for estimating flow characteristics of flood hydrographs between Portland, Colorado, and John Martin Reservoir has been prompted with the construction of the Pueblo Reservoir. To meet this need, the U.S. Geological Survey in cooperation with the Southeastern Colorado Water Conservancy District has developed a procedure for predicting floodflow peaks, traveltimes, and volumes at any point along the Arkansas River between Portland and John Martin Reservoir without considering the existing Pueblo Reservoir detention effects. A streamflow-routing model was calibrated initially and then typical flood simulations were made for the 164.8-mile study reach. Simulations were completed for varying magnitudes of floods and antecedent streamflow conditions.

Apr 81, 268p USGS-WRD-OH-80-2, USGS/WRD/HD-81/038
See also Volume 2, dated 1979, PB81-105397.

Water resources data for the 1980 water year for Ohio consist of records of stage, discharge, and water quality of streams; stage and contents, and water quality of lakes and reservoirs; and water levels and water quality of groundwater wells. This report in two volumes and one appendix contains records for water discharge at 169 gaging stations; stage and contents at 39 lakes and reservoirs; water quality at 57 gaging stations and 83 wells; and water levels at 183 observation wells. Also included are data from 84 crest-stage partial-record stations; 91 low-flow partial-record stations, and 537 coal hydrology synoptic sites. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Ohio.

FHWA/RD-80/160
Contract DOT-FH-11-9396

River behavior at a highway crossing depends not only on the stability of that particular river reach, but also on the behavior of the entire fluvial system of which it is a part. Rivers are complex landforms. A simple and straight forward approach to the identification of river hazards is not always possible. A complete evaluation of hydraulic hazards cannot be solely based on on-site hydrologic, hydraulic and geomorphic factors; but must also include insight into historic trends, synoptic consideration of basin characteristics, and anticipation of future changes. Streams can be divided into five types based on channel pattern and mode of sediment transport. Each stream type exhibits its own characteristic stability. Detailed evaluation involves consideration of many variables. After evaluating stream variables a list of potential stream hazards can be developed. To assess hydraulic hazards at a crossing it is necessary to understand the past, examine the present, and anticipate the future. Methods such as remote sensing, land use evaluation and slope stability analysis should not be overlooked.

Dispersion Studies in the Piscataqua River,
Edward Schmidt. Jun 80, 55p UNH-SG-167, NOAA-81050502

A dye tracer study in the lower Piscataqua River, New Hampshire, provided data for calibration of a two-dimensional finite element dispersion model. Approximately 50 pounds of Rhodamine WT dye was released at midchannel and continuous sampling transects were made over a single tidal cycle. Lateral and longitudinal dispersion coefficients were estimated from the measured dye concentration distribution. Recommendations are given regarding future modeling of this river reach.

Characteristics of the Ground-Water Seepage into Great South Bay,
Henry J. Bokuniewicz, and Michael J. Zeitlin. Mar 80, 39p SR-35, REF-80-2, NOAA-81042913

The water quality and salinity in Great South Bay represent a balance between the amount of seawater that enters the bay through its inlets and the amount of freshwater that is supplied from Long Island. Streamflow accounts for most of the freshwater supplied to the bay. The second largest contribution is the submarine outflow of ground water across the bay floor. Direct measurements of this source are reported here. This is the first such study of submarine outflow. Preliminary work showed that much of the seepage occurred within 100 meters of the shore. Submarine outfow rates were as high as 150 liters/day/square meter. Variations in the outflow rate due to tidal changes in the water level could not be detected. The flow rate did appear to be sensitive to coastal flooding and rainfall, however. The day after tropical storm David passed Long Island the flow values were measured at one site and found to be nearly double the typical values at that site. In order to calculate the total submarine outflow, the data were described as decreasing exponentially with distance from shore. This calculation suggests that significant amounts of ground water may enter the bay far from shore due to sustained, upward leakage from deep aquifers.

Hydrogeology, Estimated Impact, and Regional Well Monitoring of Effects of Subsurface Wastewater Injection, Tampa Bay Area, Florida,
John J. Hickey. Feb 81, 46p USGS/WRI-80-118, USGS/WRD/WRI-81-052
Prepared in cooperation with Southwest Florida Water Management District, Brooksville.

The potential impact on freshwater resources in the Tampa Bay area from subsurface injection of waste treatment plant effluent at six proposed sites located in Pinellas County, including the city of St. Petersburg, is of some concern. Projected maximum injection rate, when all sites become operational, will be about 40 million gallons per day. The injection zone at the proposed sites is a persistently dolomitized section of the Avon Park Limestone in the lower part of the Floridan aquifer. The injection zone contains ground water with chloride concentration of 19,000 to 20,000 milligrams per liter. Pressure changes and velocity that could result from injection were computed for selected regional locations. Results of model computations suggest that the regional impact during 20 years of injection within the Tampa Bay area will be small.

Water Resources Data for Kentucky, Water Year 1980.
Water-data rept.
Apr 81, 819p USGS/WRD/HD-80/044, USGS-WRD-KY-80-1
See also 1978, PB-296401.

Water resources data for the 1980 water year for Kentucky consist of records of stage, discharge, and water quality of streams; stage and contents of lakes; and water levels and water quality of wells and springs. This report contains discharge records from 116 gaging stations; stage and contents for 15 lakes; suspended-sediment data for 43 stations (28 daily); daily temperature records for 35 stations; daily specific conductance for 24 stations; ground-water level for 74 recording, 85 partial; waterquality data from 232 coal hydrology sites (28 partial, 204 miscellaneous) 3 springs and 311 wells; and miscellaneous temperature and specific conductance from the 116 gaging stations. Also included are data for 123 partial-record crest-stage and 102 partial-record low-flow sites. Data collected at various miscellaneous sites is also published. These data represents that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Kentucky.

Petrographic Characterization of Kentucky Coals. Progress Report (Six Month).
J. C. Hower. 5p DOE/PC/30223-T1
Contract FG22-80PC30223
Microfiche only after original copies are exhausted.

Three projects involve study of the form and association of pyrite in coal, study of the fluorescing macerals in western Kentucky coals, and study of the properties of the semi-inert macerals. The study of the size, form, and microlithotype association of pyrite in western Kentucky coals has shown the greatest progress. The approach to the classification has been to identify the size categories (rather than absolute size), the form (such as framboidal, euhedral, cleat, massive, dendritic), and the organic (microlithotype) association for each of 1000 pyrite grains encountered in the scan of two particulate pellets of a coal (magnification of 625 x). The present study has focused on the Springfield (No. 9) and Herrin (No. 11) coals from the western Kentucky Coal Field. Preliminary results indicate that there is a significant change in the nature of the pyrite from the Webster Syncline mine in the No. 9 coal to the Henderson Basin mine in the No. 9 coal. Changes in the petrography of the coal are also seen and both may be related to changes in the depositional environment of the coal. (ERA citation 06:023046)

Microfiche only after original copies are exhausted.

Underground Coal Gasification (UCG) offers many potential economic and environmental advantages. Offsetting these advantages is the substantial lack of ability to control the UCG process. For example, only three elements of external process control have been utilized. These are: (1) injected gas composition, (2) injected gas flow rate, and (3) product gas pressure. Variation of these independent variables in UCG tests has resulted in mixed indications of their effectiveness. This study indicates other possible elements of control based on the results of recent field tests and modeling efforts. These elements are associated with the selection of the specific site where the process is conducted and with the design of the test itself. The results of previous UCG field tests have indicated that the conditions that exist in the coal seam and overburden before the start of the combustion process may dominate all other factors. These conditions are the geotechnical characteristics, such as faulting and groundwater hydrology, as well as the details of the test layout, well completions, and linking method. Evidence exists to support the thesis that these preignition conditions can be dominant factors in process control of in-situ operations. The data from recent UCG tests have been analyzed with respect to the effect of the site geotechnical characteristics and the test design. The results of this analysis indicate that geologic faulting, coal seam permeability distributions, well completions, and coal strength are important elements of control in the process behavior. Attempts to influence Hanna IVB by varying external process parameters could not overcome these effects. Similar results have been observed in other UCG tests. (ERA citation 06:023037)

Effects of Injection Gas Composition on Modified In Situ Shale Retort Economics.
J. W. Barnes. Apr 81, 14p LA-8815-MS
Contract W-7405-EN-36
Microfiche only after original copies are exhausted.

The effects of injection gas composition on the performance and economics of a Modified In Situ oil shale retort have been examined. The injection of air could produce oil at a slightly lower price than steam-air injection. Retort systems using steam-oxygen or carbon dioxide-oxygen are economically unattractive. A system using water and air could be economical if water addition can be controlled. Approximately one-quarter of the energy is produced as a retort off-gas that has a very low heating value. Measurement of Formation Characteristics of Western Tight Sands: Project 61031 Special Core Analysis Report.
K. Sampath. May 81, 33p DOE/BC/00042-35
Contract AC19-78BC00042
Microfiche only after original copies are exhausted.

This report describes the Institute of Gas Technology's (IGT) research on tight sandstone cores from four wells. Samples from the Dakota Formation of the San Juan Basin well, Canyon Largo No. 256, were selected for comparison with the unpublished measurements by R.D. Thomas of the Bartlesville Energy Technology Center. The second well is the Mobil PCU F31-13G Well in the Piceance Basin, which is being tested under a Mobil Oil Company Department of Energy (DOE) program. The third well is the Natural Buttes Well (sec. 15, T 10S, R. 24 E.) Uinta Basin. The fourth well is the C-K Geoenergy Well DOE-GC1 (sec. 16, T 17 S., R. 24 E.) Uinta Basin. Permeability to gas was measured as a function of pore pressure, confining pressure, and partial water saturation in an attempt to estimate in-situ permeability of tight sandstones. Permeability to liquid was also measured as a function of net confining pressure, and mercury injection tests were conducted on samples to obtain capillary pressure curves. The permeability of tight sandstones was found to be strongly dependent upon net confining pressure and partial water saturation. Brine permeabilities were found to be lower than gas permeabilities extrapolated to infinite mean pore pressure for the cores studied. Under no confining stress, pore size distributions, measured by mercury injection tests, indicate that the majority of pore entry diameters range from 0.1 to 5 microns. 13 figures, 3 tables. Evaluation of CAVIJET Cavitating Jets for Deep-Hole Rock Cutting.
A. F. Conn, V. E. Johnson, Jr., H. L. Liu, and G. S. Frederick. May 81, 207p SAND-81-7067
Contract AC04-76DP00789
Microfiche only after original copies are exhausted.

A feasibility study has shown that the CAVIJET cavitating fluid jet method should be capable of successfully augmenting the cutting action of mechanical bits under deep-hole conditions. Increased rock cutting rates by existing cavitating jet nozzles can be anticipated with conventional rig pressures for hole depths of at least 1200 m (4000 ft) and possibly deeper. Improved rates of penetration, based on preliminary laboratory roller bit tests, should be achieved by simply substituting CAVIJET nozzles absorbing equivalent hydraulic power for conventional roller bit nozzles. Residual-Oil-Saturation-Technology Test, Bell Creek Field, Montana. Final Report.
Jun 81, 140p
Contract AC03-78ET12366

A field test was conducted of the technology available to measure residual oil saturation following waterflood secondary oil recovery processes. The test was conducted in a new well drilled solely for that purpose, located immediately northwest of the Bell Creek Micellar Polymer Pilot. The area where the test was conducted was originally drilled during 1968, produced by primary until late 1970, and was under line drive waterflood secondary recovery until early 1976, when the area was shut in at waterflood depletion. This report presents the results of tests conducted to determine waterflood residual oil saturation in the Muddy Sandstone reservoir. The engineering techniques used to determine the magnitude and distribution of the remaining oil saturation included both pressure and sidewall cores, conventional well logs (Dual Laterolog - Micro Spherically Focused Log, Dual Induction Log - Spherically Focused Log, Borehole Compensated Sonic Log, Formation Compensated Density-Compensated Neutron Log), Carbon-Oxygen Logs, Dielectric Logs, Nuclear Magnetism Log,

Thermal Decay Time Logs, and a Partitioning Tracer Test. (ERA citation 06:021572)

Pulsating-Flow Measurement with an Orifice Flange.
L. M. Bossart. 1981, 7p CONF-810637-1
Contract AC08-76NV01183
11. transducer workshop, Seattle, WA, USA, 2 Jun 1981.

This paper resulted from a measurement problem encountered during instrumentation of a Geothermal air drilling operation on the Baca Ranch in the Jemez Mountains in New Mexico. The problem was how to measure the flow of ammonia water solution injected into the air line. The flow is pulsating as the pressure in the ammonia line fluctuates above and below the pressure in the air line. The pump that develops the pressure in the ammonia line is not a positive displacement pump, therefore, counting pump strokes does not determine the number of gal/min of ammonia flow. The flow was measured using an orifice flange differential pressure technique but, the range of flow measured, exceeded the 4:1 range ability of an orifice. A computer smoothing of the differential pressure and the line pressure together with a scaling factor, determined by the shape of the raw differential pressure, provided a smoothing of the flow data which was checked against the actual flow over a long time period to determine the volume of solution injected into the system per hour. An instantaneous reading of ammonia flow was thereby determined. It showed small variations in corrosion rate measured in the standpipe that may have been caused by a momentary variation in the flow of ammonia solution. (ERA citation 06:021971)

Airborne gamma-Ray Spectrometer and Magnetometer Survey: Wenatchee, Concrete, Quadrangles (Washington). Final Report.
1981, 73p
Contract AC13-79GJ01692
Includes 64 sheets of 48x reduction microfiche.

An airborne combined radiometric and magnetic survey was performed for the Department of Energy (DOE) over the area covered by the Wenatchee and Concrete, 1:250,000 National Topographic Map Series (NTMS), quadrangle maps. The survey was part of DOE's National Uranium Resource Evaluation (NURE) program. Data were collected by a helicopter equipped with a gamma-ray spectrometer with a large crystal volume, and with a high sensitivity proton precession magnetometer. The radiometric system was calibrated at the Walker Field Calibration pads and the Lake Mead Dynamic Test Range. Data quality was ensured during the survey by daily test flights and equipment checks. Radiometric data were corrected for live time, aircraft and equipment background, cosmic background, atmospheric radon, Compton scatter, and altitude dependence. The corrected data were statistically evaluated, plotted, and contoured to produce anomaly maps based on the radiometric response of individual geological units. The anomalies were interpreted and an interpretation map produced. Volume I contains a description of the systems used in the survey, a discussion of the calibration of the systems, the data collection procedures, the data processing procedures, the data presentation, the interpretation rationale, and the interpretation methodology. A separate Volume II for each quadrangle contains the data displays and the interpretation results. (ERA citation 06:021634)

Preliminary Study of the Transport and Distribution of Radium, Radon and Their alpha-Emitting Daughters Using Nuclear Emulsions and Polonium-210. Final Report.
L. R. Stieff, I. L. Balkissoon, and F. M. Barbera. Mar 81, 168p
Contract AC13-GJ01664

Semi-quantitative Po-210 measurements were made on near surface soil samples near known uranium ore deposits and on closely related diamond drill cores. The physical distribution of uranium and some of its alpha emitting daughter products in these samples was studied qualitatively using alpha sensitive nuclear emulsions. These nuclear emulsion plates suggest that U-238 and its long lived daughters U-234, Th-230 and Ra-226, deposit on grain surfaces in very low concentrations (U-238 in sub picogram amounts). Concentrations of alpha activity usually associated with discrete uranium were not observed. On the basis of alpha star counts in the emulsion, Ra-226 appears to be more mobile than Rn-222. Measurements of Po-210 provide an indirect means of estimating the number of Rn-222 atoms that have decayed over the last 80 to 100 years. Many Po-210 highs have been observed in the Red Desert (Wyoming) cores; some directly associated with uranium mineralization. Evidence was not found for the predicted Po-210 concentration gradient produced by the decay of mobile, unsupported Rn-222. The Po-210 analyses and microscopic studies suggest that observed Rn-222 and Po-210 surface anomalies may be associated with widely dispersed very low concentrations of Ra-226 or its longer lived parents including uranium which surround the ore as halos or as weak zones of uranium mineralization. The Po-210 sub-surface soil anomaly map from this study was also compared with earlier surface anomaly maps from the same area based on helium, radon by Track-Etch and uranium surveys. Selective chemical leaching experiments undertaken in an effort to enhance the mobile Ra-222/Po-210 signal were not successful. (ERA citation 06:021640)

Contract W-7405-ENG-36
Society of Well Log Analyst's annual meeting, Mexico City, Mexico, 20 Mar 1981.

Amplitudes of S and P waves from commercial borehole acoustic logging tools depend on the angle between the borehole axis and the direction of propagation as well as the distance between source and receiver. Knowledge of the angular dependence or radiation pattern, is necessary to properly measure the attenuation of waves traveling between two boreholes. Functional expressions are shown for the S and P-waves amplitudes. Experimental work in relatively homogeneous granite suggests that this relationship adequately describes the radiation pattern for both explosive sources and for acoustic transducers placed in fluid filled boreholes. Using these functional expressions for the S and P-wave amplitudes a technique was developed to estimate Q, the quality factor, and locate discrete fractures in crystalline rock that compose the Hot Dry Rock Geothermal Reservoir at Fenton Hill, New Mexico. Contract W-7405-ENG-36
Geothermal Resources Council symposium, Portland, OR, USA, 19 May 1981.

The Hot Dry Rock (HDR) method of heat extraction was developed by Los Alamos in silicic plutonic-metamorphic rocks of Precambrian age. Now that the method and mechanisms are better understood, other rock types are under consideration as potential HDR reservoirs. High heat flow over much of the Northwest indicates the potential for geothermal power and heat is great if ways to develop it could be found. Currently two conceptual models for HDR development in volcanic rocks are under development. Experiments planned for this summer should indicate how the rocks behave and how this behavior compares to existing models. (ERA citation 06:021972)

Seasat Satellite Investigation of the Structure of Western Nebraska and Its Application to the Evaluation of Geothermal Resources.
J. Stix. 1981, 20p CONF-810557-1
Contract W-7405-ENG-36
International symposium of remote sensing of environment, Ann Arbor, MI, USA, 11 May 1981.

Seasat synthetic aperture radar (SAR) satellite imagery was used to interpret the structural framework and, indirectly, the geothermal potential of an area in western Nebraska. Lineaments were mapped from the imagery and then compared to known structure. It was found that Seasat does record surface manifestations of subtle basement structures, particularly faulting. Furthermore, four areas with geothermal potential were delineated using Seasat and other data. It is stressed that more subsurface geology and geophysical data are needed before a final evaluation of the geothermal potential can be made. Seasat imagery is a useful reconnaissance exploration tool in the interpretation of regional structure within areas of little topographic relief. (ERA citation 06:023389)

New NMR Well Logging/Fracture Mapping Technique with Possible Application of SQUID NMR Detection.
J. A. Jackson. 1981, 6p CONF-810660-2
Contract W-7405-ENG-36
SQUID applications to geophysics workshop, Los Alamos, NM, USA, 2 Jun 1981.

A new method for making NMR measurements has been developed that potentially can receive NMR signals from a precise distance into the geologic formation. It is based on the production of a toroidal region of homogeneous radial magnetic field near the mid-plane between two magnets arranged axially so their fields oppose between them. NMR signals have been detected from such

a region in the laboratory. Preliminary data have been extrapolated to the projected performance of a logging tool using superconducting magnets. The presence of cryogenic temperatures required for these magnets may make signal detection using SQUIDs a logical consideration. Preliminary comparison of normal and SQUID NMR detection shows that near the borehole (<18 in.) standard NMR detection is probably superior; at greater distances SQUID detection may be advantageous. Directional detection of the signal may allow fractures near the wellbore to be mapped. Use of SQUID detection may be useful for this application. (ERA citation 06:024108)

Characterization of Hot Dry Rock Geothermal Energy Extraction Systems.
J. N. Albright, and C. A. Newton. 1981, 7p
CONF-810660-1
Contract W-7405-ENG-36
SQUID applications to geophysics workshop, Los Alamos, NM, USA, 2 Jun 1981.

The engineering of heat exchange systems by which geothermal heat can be efficiently extracted from hot impermeable rocks is studied. The system currently under investigation at Fenton Hill, New Mexico consists of a network of large fractures created through the hydraulic pressurization of a well penetrating hot basement rocks and subsequently intersected by a second well drilled to form a flow-thru system. Cool water pumped into the fractures through one well, once heated in the reservoir, returns to the surface through the second well, is cooled, and then recirculated. While much is known about the performance parameters of the fracture network from short-term flow tests, little is understood concerning the spatial dimensions and geometrical relationship of individual fractures comprising the network. Ultimately, the success one has in estimating the long-term performance of such a system where commercialization is an issue, and in engineering future systems with optimal performance, depends on the success in characterizing the flow-thru fracture networks. To date only nonconventional application of oil field logging techniques and acoustic emissions studies have been used in the characterization of the fracture network. (ERA citation 06:023398)

Identification of Geothermal Reserves and Estimation of Their Value.
J. H. Howard. Dec 80, 12p CONF-801233-9
Contract W-7405-ENG-48
Annual workshop on geothermal reservoir engineering, Stanford, CA, USA, 16 Dec 1980.

A procedure, is discussed for estimating the value of a hot water geothermal property from a resource owner's point of view. Two methods make up the procedure: a conservative method of estimation and an optimistic one. Value of a property by both methods is estimated to equal the present value of future income less the cost of resource extraction. The two methods share a common set of assumptions (e.g., that the price of hot water at the start of cash flow from a project will be the same). However, the methods differ in important ways. The optimistic method, for example, allows for future increase in price that in turn offsets discounting of future income. Together the methods define a range of values that might reasonably be assigned to a property. (ERA citation 06:021967)

Multilayer Pressure Vent for Explosion Proof Enclosures.
Patent Application,
Robert J. Gunderman, and Michael W. Riley.
Filed 5 Dec 80, 12p PB81-222630, DOCKET/MIN-3014
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The patent application describes a pressure vent for an explosion proof container. The vent allows a high flow rate of gases to pass from the container while arresting flames and cooling exiting hot gases therein. This precludes the build-up of high peak pressures inside the container. Structurally the vent has a protective cover mounted to the container by a knife hinge on one side and closed by imbedded magnets on the opposite side. In addition, the vent has multilayered material mounted in the same container opening near the interior of the container. A layer of porous stainless steel foam with multiple layers of stainless steel screen is used for this vital multilayered material. The optimum embodiment is obtained by preselecting a relationship between the free space volume inside the enclosed container, the number of layers in the prefilter section of the vent, and the cross sectional area of the vent.

Resource and Potential Reclamation Evaluation of Beulah Trench Study Area, West Renners Cove Coalfield, Mercer County, North Dakota: ERMIA (Energy Mineral Rehabilitation Inventory and Analysis) Report No. 10, 1977.
Summary rept. (Final) 1977-81.
May 81, 27p BLM-YA-PT-002-7330
Prepared in cooperation with Water and Power Resources Service, Billings, MT., and Geological Survey, Reston, VA. See also PB81-212524.

This multidisciplinary effort was conducted in order to provide information for establishing reclamation objectives and lease requirements should coal development occur in the Beulah Trench study area. Beulah Trench is located in the West Renners Cove coal field, Mercer County, North Dakota. All coal in the study area is Federally owned. All surface is privately owned. Information is provided on geology, coal resources, overburden (soil and bedrock), greenhouse, vegetation, hydrology, climate, and physiography. Most resources were found to have good reclamation potential. Leasing recommendations are made for those resources which could experience adverse impacts from mining.

Wallrock Reactions to Mining Beyond a Preconditioned Zone at the Star Mine, Burke, Idaho.
Final rept. 23 Mar 78-23 Mar 79,
Wilson Blake. Apr 80, 45p BUMINES-OFR-52-81
Contract H0262039

Rock preconditioning in advance of mining has been an effective means of rock-burst control based on the results of field demonstrations carried out on the 7700 level of the Hecla Mining Co.'s Star mine. Mining through the preconditioned zone was characterized by greatly reduced rates of released seismic energy and no bumping or rock bursting occurred within the preconditioned zone. Mining above the preconditioned zone was characterized by greatly increased rates of released seismic energy and rock bursting, particularly where the vein became very narrow in waste zones. This increased incidence of rock bursting points out the need for stope preconditioning to be carried out on an entire stope block basis.

Analysis of Fire Data, Large-Scale Tests, and Small-Scale Tests for Conveyor Belts Used in Underground Coal Mines.
Final rept.,
Emil Braun, Robert E. Meade, and Lee R. Smith. May 81, 106p NSBIR-81-2256
Sponsored in part by Bureau of Mines, Pittsburgh, PA. and Mine Safety and Health Administration, Triadelphia, WV.

An investigation into the requirements and fire test performance of conveyor belts intended for use in underground coal mines was conduted. The aim of this study was to develop recommendations for the Mine Safety and Health Administration (MSHA) on a test method suitable for measuring the fire hazard potential of a conveyor belt in a coal mine environment. A review of incident data, large-scale tests, and small-scale tests was conducted to provide the necessary information. The incident data was analyzed with the goal of developing scenarios that could form the basis for a suitable test to evaluate the appropiateness of the existing test. Large-scale tests were reviewed to determine anticipated belt fire performance under 'realistic' end-use conditions. The tests showed how geometry, input energy, and ventilation controlled belt fire performance. Small-scale tests were used to provide information on specific fire properties such as ease of ignition, flame spread, and smoke generating potential.

Preconditioning an Entire Stope Block for Rock Burst Control.
Final rept. 23 Mar 79-23 Mar 80,
Wilson Blake. May 80, 33p BUMINES-OFR-51-81
Contract J0295080

Rock preconditioning in advance of mining has been an effective means of rock-burst control based on small-scale field demonstrations. The objective of this investigation was to test the effectiveness of rock preconditioning on a larger scale and to determine whether the preconditioning would be effective over a specific period of time. Preconditioning in 8 and 12 crosscuts on the 7900 level of the Hecla Mining Co.'s Star mine involved about 7,232 feet of drilling and the blasting of about 10,055 pounds of high explosives to precondition a block of ground along the main vein of about 450 feet long, 50 feet above and 40 feet below the level. The slight amount of seismic energy accompanying the initial raiseup in the preconditioned stopes indicates that this preconditioning was successful. Continued monitoring should be carried out to determine whether the preconditioning remains effective over the length of time required for the completion of mining in a stope block.

Contract JO285041

Drive systems for mining machines are usually sized to accommodate anticipated peak loads. Usually, the average power requirements are considerably less. Energy storage and power averaging are attractive concepts for mining machinery and could have far-reaching implications. The purpose of this program was to identify truly feasibile concepts; identify advantages and/or disadvantages, limitations, and constraints; evaluate feasibility based on today's technology; identify anticipated safety problems; and provide the designer with a comprehensive literature base. Concepts evaluated include flywheels, high energy batteries, gas-charged accumulators, inductive storage, capacitive storage, springs and counterweights, thermal, closed cycles, internal combustion engines, and trolley and hybrid systems. A comprehensive index is provided, and an appendix is included containing abstracts of the pertinent literature.

Selective Interburden Handling Techniques Volume I - Summary.
Contract research (Final), 27 Sep 78-29 Aug 80,
Robert L. Lappi, and George M. Smrikarov. Sep 80, 125p BUMINES-OFR-80(1)-81
Contract J0285025

Eight interburden handling concepts are developed for multiple seam area mine stripping operations in central and western United States. They are based on data gathered and analyzed during field surveys, literature reviews, and visits to State regulatory agencies in five States. It is concluded that improvement of reclamation practices through selective interburden handling techniques is possible at lower operating costs than currently incurred. Specific multiple seam mining systems are discussed in this report.

Contract DI-J0285025

A summary of the major findings of the literature survey for interburden handling concepts are presented. Literature pertaining to mine practices in multiseam strip mining operations were reviewed. The survey covered two coal regions: the Western coal region with emphasis on the Northern Great Plains coal province and the Interior Central coal region with emphasis on the tri-State area of Illinois, Indiana, and west Kentucky. Previous works on multiseam mining and selective handling techniques were identified and evaluated. The effects of the current proposed State and Federal surface mining laws on alternative interburden handling techniques employed in the Western and Central coal regions are discussed.

A Model for the Determination of Flyrock Range as a Function of Shot Conditions.
Final rept. 22 Jul 78-16 Apr 79,
Julius Roth. 16 Apr 79, 97p BUMINES-OFR-77-81
Contract DI-J0387242

Flyrock is the source of most of the injuries and property damage in a majority of blasting accidents in surface mines. A quantitative correlation between shot conditions and maximum flyrock range can be used to define a blasting area in which no personnel or equipment should be present during a shot. The approach used was to develop a model that correlates shot conditions and initial flyrock velocities and permits computation of flyrock range from ballistic trajectories. The Gurney formula for velocity of explosively propelled plates or fragments was adapted to explosively propelled flyrock from vertical rock faces or from bench tops. The modified Gurney formula was then calibrated with measured flyrock velocities from mining and explosives literature. Charts were then developed for possible field use that gives maximum flyrock range as a function of shot conditions.

Contract H0272008

Many underground coal mines are composed of shale layered directly over the coal that weathers severely immediately after exposure to the mine atmosphere. Condensation of ventilating air causes underground coal mines to become wet during warm months; during cool months, the mines become dry from evaporation. The fluctuating mine atmosphere is responsible for the severe shale break-up experienced during the summer and the lessening of the break-up through the winter months. The objective of this investigation was to design and construct spray equipment to be mounted on a continuous miner for sealing the mine roof immediately after exposure. Selection of the sealant material and a field evaluation of the equipment is included.

W. G. Freeman, R. M. Jones, J. G. Babcock, M. L. Christo, and R. A. Noel. Jun 80, 748p
BUMINES-OFR-85-81
Contract J0295039

The purpose of this study was to gather representative sampling of underground mines in various counties in the State of Nevada and to determine which of these mines had openings representing a hazard or threat to the general public. Based on the selection of 157 target mining districts, 200 inactive mines were selected and visited as a representative sample. The sample was categorized and listings were made by county, type of opening, degree of risk associated with the opening, and the closure method recommended. Each mine site was photographed and the name, location, commodity, historical and geologic value, future mining potential, and to closure of inactive mines were researched and summarized. It was concluded that permanent mine closure is seldom desirable; low cost, easily installed closures of a semipermanent-to-temporary variety are most appropriate; and sufficient legal mechanisms exist to protect the public if and when applied.

Development and Testing of FIDELE: a Computer Code for Finite-Difference Solution to Harmonic Magnetic-Dipole Excitation of an Azimuthally Symmetric Horizontally and Radially Layered Earth.
C. N. Vittitoe. Apr 81, 59p
Contract AC04-76DP00789

The FORTRAN IV computer code FIDELE simulates the high-frequency electrical logging of a well in which induction and receiving coils are mounted in an instrument sonde immersed in a drilling fluid. The fluid invades layers of surrounding rock in an azimuthally symmetric pattern, superimposing radial layering upon the horizonally layered earth. Maxwell's equations are reduced to a second-order elliptic differential equation for the azimuthal electric-field intensity. The equation is solved at each spatial position where the complex dielectric constant, magnetic permeability, and electrical conductivity have been assigned. Receiver response is given as the complex open-circuit voltage on receiver coils. The logging operation is simulated by a succession of such solutions as the sonde traverses the borehole. Test problems verify consistency with available results for simple geometries. The code's main advantage is its treatment of a two-dimensional earth; its chief disadvantage is the large computer time required for typical problems. Possible code improvements are noted. Use of the computer code is outlined, and tests of most code features are presented. (ERA citation 06:022521)

Direct Observation of a Sand-Propped Hydraulic Fracture.
N. R. Warpinski, L. D. Tyler, W. C. Vollendorf, and D. A. Northrop. May 81, 65p
Contract AC04-76DP00789

An experiement has been conducted in which a sand-propped hydraulic fracture is created and then mined back to observe fracture behavior and proppant distribution. Three stages of different colored, different concentration sand transported by a water-based gel were injected into a volcanic ash fall tuff formation at a depth of 1400 ft near an existing tunnel complex. The resultant fracture was subsequently mined back for direct observation and photographed and mapped. This particular region was highly faulted and exhibited significant changes in in situ stress magnitudes across the faults; it is felt that this stress distribution resulted in very complex fracture behavior and growth processes. The fracture was bounded on one wing by a fault which was only a few feet from the wellbore. The fracture terminated on top at an unbonded bedding plane. Most of the injected volume of sand and fluid was forced downward, considerably below the elevation where the fracture was initiated. The different colors of sand were randomly distributed, although they were usually found in distinct layers, but this may have been due to the complex growth process. At different locations the fracture was found to have considerable variations in width; from several sand grains wide (1 cm) to devoid of sand altogether (2 to 3 mm average). Lawrence Livermore National Lab., CA.
Direct Observation of Explosively Induced Damage in Sandstone with Application to Reservoir Stimulation.
W. B. Durham. 1981, 10p CONF-810410-4(Rev.1)
Contract W-7405-ENG-48
Scanning electron microscopy conference, Dallas, TX, USA, 14 Apr 1981.

Samples of a porous, partially saturated, loosely consolidated, gas-bearing greywacke sandstone which had been subjected to explosive loading in the laboratory at three effective confining pressures, 0, 24, and 48 MPa, were observed by scanning electron microscopy. Qualitatively, damage decreased with increasing distance to the shot point. Damage was evident as fracturing and compaction in a zone within 10 mm of the explosion point, and as fracturing without significant volume change to a radius of 20 to 30 mm. An attempt to quantify the relationship between damage and distance for the purpose of verifying modeling predictions produced very imprecise results. Clay particles, chiefly kaolinite, which pervade pre-existing cracks and pores are displaced by the explosion but individually are deformed very little. The clays appear to have the ability to blunt crack tips. Microfractures are typically less than 100 mu m long (one grain diameter or less) and none is longer than 300 mu m. The absence of long fractures suggests that reservoir stimulation by explosive loading in this material does not appear promising. (ERA citation 06:021605)

Ultrasonic Thermometry in Oil Shale Retorts.
J. J. Ronchetto. 6 May 81, 12p CONF-810607-1
Contract W-7405-ENG-48
Symposium on instrumentation and control for fossil energy processes, San Francisco, CA, USA, 8 Jun 1981.

The method relies on the principles of ultrasonic reflectometry to locate and determine temperatures within zones of a slender-rod-sensing element installed in the in-situ retort bed. The measurement technique consists of sending an ultrasonic pulse down an element containing n zones spaced along its length. The zone boundaries are defined by $n + 1$ discontinuities within the element. The time intervals between pairs of returning echoes, caused by reflections from these discontinuities, are measured electronically. These measured time intervals are then related to the average temperature of the corresponding zones. Preliminary results are encouraging, and it appears that the ultrasonic thermometer can be a useful in situ instrument. (ERA citation 06:021612)

Coordination of Marine Remote Sensing Activities with Special Emphasis on MARSEN.
Final rept. 15 Aug-15 Oct 79.
31 Mar 80, 5p
Contract N00014-78-C-0438

Rapid developments in application of remote sensing techniques to oceanography came about because of the Seasat-1 initiative, the first oceanographic satellite designed to demonstrate such proof of concept. Simultaneous with and complementary to the Seasat objective, large-scale experiments were conducted to provide insight on the interaction between electromagnetic waves and the ocean surface. The Marineland and West Cost Experiments were the forerunners of such experiments. MARSEN was conducted during 15 August - 15 October, 1979 as the third of such large scale experiments. The present effort was staged to provide communication between and coordination of the various elements involved in the

MARSEN field operations. The careful and advance planning for the MARSEN Experiment achieved unprecedented success in soliciting financial support for this complex experiment. The experiment was successfully executed according to the MARSEN Test Plan. It is estimated that 90 - 95% of all data sought after was acquired. The extensive data sets and research topics are summarized in a Data Analysis Plan which will serve as a guide for the data analysis phase until the results are reported in the technical journals.

Oceanographic Observations in the Indian Ocean, March 1978. A Chemical Survey by Marine Environment Group.
Russell W. Pettis, and Daniel J. Whelan. Sep 80, 82p Rept no. MRL-R-792
Availability: Microfiche copies only.

Chemical and physicochemical data on water samples taken at depths down to 4000 metres from eleven stations in the South-East Indian Ocean in March 1978 have been compiled. Samples from each station were analysed for variations with depth of temperature, salinity, pH and alkalinity, dissolved oxygen, metal ions and nutrients. From this material, comments have been made about certain parameters in sea water which may have long-term operational significance, viz. sound speed at various depths, the location of the deep ocean sound channel axis, the absorption of sound in sea water and the nature of the chemical environment at these stations. Contract N00014-75-C-0502

The University of Washington's Department of Oceanography has established comprehensive teaching and research programs, which are conducted by a diverse group of faculty, staff, students, and support personnel. More than 120 projects comprise our research program, which covers a broad range of oceanographic investigations and has annual expenditures in excess of eight million dollars. These investigations range from individual research projects to multidisciplinary and/or multiuniversity projects, such as the Deep Ocean Mining Environmental Study (DOMES), the first GARP Global Experiment (FGGE), the First International Biomass Experiment (FIBEX), the Global Atlantic Tropical Experiment (GATE), the International Program of Ocean Drilling (IPOD) supported by the Deep Sea Drilling Project (DSDP), the International Southern Ocean Studies (ISOS), the Manganese Nodule Program (MANOP), the Outer Continental Shelf Environmental Assessment Program (OCSEAP), the Joint U.S.-U.S.S.R. Mid Ocean Dynamics Experiment (POLYMODE), the Processes and Resources of the Bering Sea Shelf Program (PROBES), the Rivera Ocean Seismic Experiment (ROSE), and the proposed Subarctic Pacific Ecosystem Research Program (SUPER).

Contract N00014-79-C-0227

A wide variety of scientific investigations can be pursued with air deployed oceanographic moorings which are configured to specific scientific requirements. Also, a number of important oceanographic studies could be accomplished by deploying oceanographic moorings through the polar sea ice from long-range aircraft. Two systems are being developed: an open ocean moored system, and an ice-covered ocean-suspended system. Both systems are configured to measure temperature, conductivity, and pressure; however, the system design maintains flexibility to allow the addition of other types of sensors. (Author)

Derivation of Shallow Ocean Bottom Reflectance Values from Color Aerial Photography,
Donald J. Gerson, Lynn K. Fehrenbach, Kenneth R. Piech, and David W. Gaucher. Jun 81, 22p

An alternative to the field survey method of acquiring hydrographic data is described. The technique involves the use of digitized color aerial photography in the derivation of the percentage of reflectance of shallow ocean bottom materials. These spectral reflectance values can then be used in an algorithm for calculating water depths. The reflectances that were derived in this study show a close relative comparison to ground truth information. After a discussion of the causes of discrepancies between derived and actual reflectance values, it is concluded that this method of data acquisition merits further investigation due to its high geometric fidelity, its simplicity, and its cost and time-saving benefits. The report describes a theory for hydrofracture pressure prediction derived based on mechanics involved which may not have been previously considered. Laboratory tests were used to analyze the behavior of K sub 0 for various materials under conditions which may exist in the earth. This was done in an attempt to find a relationship between K sub 0 and materials parameters which will enable estimation of K sub 0 from information obtained from cuttings during the drilling process.

Contract F49620-79-C-0098, ARPA Order-3291
Availability: Microfiche copies only.

An orientation study on regional seismology in Argentina reveals extensive actual and projected seismometry. Data digitization is being initiated at some stations, and modern computing systems are being acquired. Most of the regional seismicity is explained in terms of the subduction of the Nazca plate under the South American continent, but also intraplate earthquakes have occurred. Part of the subduction, initially with a dip angle of 30 deg, is horizontal. Seismicity gaps exist in the Province of Tucuman, and in depth between 350 and 500 km. Source parameters for the Salta, 1973 and Caucete, 1977 earthquakes are reported. Refraction profiles suggest complex velocity structures in the earth's upper 6 km. Short-period noise levels vary more than 30 dB with local geologies. Micro-seismic storm long-period energy is mainly between 5 and 10 seconds periods. Negative first motion on Argentinian P-waves from Nevada Test Site presumed underground nuclear explosions may indicate tectonic strain release associated with these events. Primary Eurasian event signals are PKP-waves, in correspondence with standard travel time vs. distance curves. Signal arrivals between P- and S-waves seem to be P- to S-wave and S- to P-wave conversions on the lithosphere-asthenosphere boundary, according to the literature, suggesting that this boundary may be at a depth of 400 km. Seismic Detection and Discrimination Using Ocean-Bottom Seismographs.
Annual technical rept. 1 Oct 79-31 Dec 80,
Leroy M. Dorman, J. A. Orcutt, and Thomas H. Jordan. May 81, 76p AFOSR-TR-81-0535
Contract F49620-79-C-0019, ARPA Order-3291

Around January 29, 1980 a mild storm occurred on the Southern California coast. During this time one of our ocean bottom seismographs (O.B.S.) was periodically recording noise samples at 31 deg N, 119 deg 48 min W, about 370 km offshore in 4 km of water. The noise energy in the 1-3 Hz frequency range correlates most strongly with the wave height on the nearby coast. The local and distant wind data were dissimilar in the durations of the disturbance and in the time of the peak amplitude. We conclude that sea floor noise near 1 Hz comes predominantly from the surf. The nonlinear mechanisms which transfer energy from gravity waves on the sea surface into the sea floor are so inefficient at these frequencies that the contribution from surf a few hundred km away dominates the energy from the sea surface a few km away. An array of 4 ocean-bottom seismometers (O.B.S.) was operated for one month during June-July, 1977 at 16.5 deg N, 100.5 deg W in the Middle America Trench near Acapulco. The purpose of the experiment was to investigate the seismicity of the accretionary prism and to study the propagation of seismic waves across the continental margin. The location of earthquakes occurring landward of the OBS array was controlled by a 7-station land-based array operated by a team of Mexican seismologists under the direction of Dr. Lautaro Ponce Mori.

Propagation Path Effects for Rayleigh and Love Waves.
Final rept. 15 Jul 76-31 Oct 80,
Eugene Herrin, and Tom Goforth. May 81, 113p AFOSR-TR-81-0534
Contract F49620-76-C-0030, ARPA Order-3291

Phase-matched filters have been developed for several paths of interest for both Rayleigh and Love waves. The filters are presented in the form of tabled values of apparent group velocity as a function of frequency. Detailed instructions are given as to how the tabled values can be used to construct phase-matched filters and how the filters can be applied to low-level signals which have travelled the same path. Application of the filters provides a time series in which the effects of multipaths have been minimized and on which the signal-to-noise ratio is improved by a factor proportional to the time compression of the signal achieved by the filtering. For a signal bandwidth of 0.1 - 0.015 Hz and an epicentral distance of 30 degrees, the signal-to-noise ratio is about 10 dB better than on the original seismogram. The filtered seismogram can be used for the determination of surface wave magnitude. (Author)

Properties of Ambient Seismic Noise and Summary of Noise Spectrum in the Vicinity of RSTN Sites.
S. R. Taylor. 26 Jan 81, 48p UCID-18928
Contract W-7405-ENG-48
Microfiche only after original copies are exhausted.

The general characteristics of seismic noise are reviewed in terms of its source, mode of propagation, seasonal variations, and variation with depth. The characteristics of the noise spectrum as a function of depth are important for extrapolating surface noise surveys to the expected noise in a borehole. A literature review of measured noise spectra in the vicinity of the five proposed Regional Seismic Test Network sites is combined with direct noise measurements from the National Seismic Station at the Cumberland Plateau Observatory and the LRSM station at Red Lake, Ontario. Results from a recent noise survey in the Adirondacks and Black Hills are also reviewed. Minimum noise values at all five Regional Seismic Test Network sites are tabulated at 1 Hz and appear to be higher than those of the low noise model of Brune and Oliver. (ERA citation 06:024423)

Contracts DI-14-31-0001-4051, DI-14-31-0001-5051
Sponsored in part by Department of Commerce, Washington, DC.

Snow measurement with a precipitation gage is affected by snow properties, air turbulence, and gage configuration. Various shields are used to reduce the effects of these factors and to improve the catch performance of the gage. In this investigation, comparisons were made of several. In addition, Hamon's proposed dual-gage approach was tested and the effects of wind speed and air temperature on the gage catch were analyzed. Precipitation measured by an Alter-shielded gage in a forest opening was used as the standard catch. The catch by the Raised-Wyoming-shielded gage was found to be free from wind effects and to correlate well with the standard catch.

Application of Surface Analysis Techniques to Pulsed Power Problems.
Technical rept.,
G. L. Jackson. 23 Mar 81, 146p AFOSR-TR-81-0501, AFOSR-PP-1
Contract F49620-79-C-0191

An assessment of some of the advantages and disadvantages of various surface analysis techniques applied to the analysis of both the insulators and conductors used in high voltage spark gaps is presented. Some of the analysis techniques introduced include Electron Spectroscopy for Chemical Analysis, Auger Electron Spectroscopy, X-ray Fluorescence, and Secondary Ion Mass Spectroscopy. The purpose of this review is to present some of these analysis techniques with emphasis placed on those techniques which give information about changes that occur on or near the surfaces on insulators and conductors. Surface charging makes most analysis techniques incapable of giving useful information about the changes on or near the surface of insulators. Because of the amount of information available from a single ESCA spectrum, such as shifts in binding energies due to changes in chemical environment, Auger electron peaks due to the relaxation of the atom after photoionization, and the quantitative information, ESCA is the best analysis technique available for the investigation of insulators. Also the problem of surface charging in ESCA is minimal. The analysis of conductors, however, is less complicated because surface charging is no longer a problem. Therefore, the use of AES, SIMS, and ESCA can all give some useful information about conductor surfaces.

Partial Discharge Testing of Bulk Transformer Oil.
G. J. Rohwein. 1981, 4p SAND-81-0551C, CONF-810659-8
Contract W-31-109-ENG-38
IEEE international pulsed power conference, Albuquerque, NM, USA, 1 Jun 1981.
Microfiche only after original copies are exhausted.

The generation of partial discharges in bulk transformer oil has been investigated experimentally to determine the dominant conditions which contribute to their formation and growth under repetitive impulse stresses. The motivation for conducting these experiments arose from a problem with partial discharges and breakdowns occurring in the insulating oil around the high voltage switch in a continuous running 1.5 MV repetitive pulser system. From the experiment it was found that repetitive stressing caused low level field ionization around the electrodes which led to bubble formation and eventually partial discharges. There were also qualitative indications of charge accumulation in the oil. Photographic records of numerous shot sequences were used to study the phenomena. (ERA citation 06:023459)

Waveguide Coupler Using Three or More Wave Modes.
Patent Application,
Larry R. Barnett. Filed 27 Apr 81, 21p AD-D008 549/8
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A coupler is given employing two similar sections of waveguide which extend colinearly in longitudinal succession. Adjacent ends of the guide sections are spaced apart to form a gap in the boundary of the sections. A third section of waveguide is disposed external to and coaxial with at least a part of each of the the two waveguide sections to provide a boundary surrounding the gap. Electromagnetic energy propagating down one of the two similar sections of waveguide in a first mode and entering the gap is converted partly to a plurality of other modes. The converted energy is reconverted to the first mode upon reaching the other of the two similar sections of waveguide. The electric field pattern exciting the section of waveguide at the end of the gap and propagating down it is exclusively in the first mode. The cutoff-determining dimensions of the third section of waveguide and the gap separation are determined from the condition that the phase relationship between the modes at the end of the gap be the same, to within a integral multiple of 2 pi, as what they were at the beginning of the gap, to insure complete transfer of power between the two similar sections of waveguide. Optical Measurements for Interfacial Conduction and Breakdown (1980).
Annual rept.,
R. E. Hebner, E. F. Kelley, J. E. Thompson, T. S. Sudarshan, and T. B. Jones. May 81, 90p NBSIR-81-2275
Sponsored in part by Department of Energy, Washington, DC. Prepared in cooperation with South Carolina Univ., Columbia, and Colorado State Univ., Fort Collins.

Techniques have been developed to measure the electric field distribution along an interface between insulating materials. Specifically, systems have been developed to measure the fields in transformer oil using the Kerr effect and to measure the surface charge at a gas-solid interface using the Pockels effect. Measurements are supplemented by calculations of the distortion produced by selected interfacial charge distributions. The relatively pure transformer oil used in these studies showed little space charge distortion of the electric field. THere also was no statistically significant preference for breakdown in the vicinity of the interface. At vacuum-solid interfaces, however, interfacial breakdown was observed and surface charging was measured. As gas is introduced into the system, the surface charge is removed so that no effect of surface charging was detected at atmospheric pressure. At pressures above atmospheric, there is evidence that surface charging may again become important.

Concurrency Control Overhead or Closer Look at Blocking vs. Nonblocking Concurrency Control Mechanisms,
Dusan Z. Badal. Jun 81, 25p Rept no. NPS52-81-005

In this paper we divide concurrency control (CC) mechanisms for distributed DBMS's (DDBMs) into three classes. One class consists of blocking CC mechanisms and two classes contain nonblocking CC mechanisms. We define CC overhead and derive it for conflicting and nonconflicting transactions for each class of CC mechanisms. Since CC overhead is dependent on CC mechanism only, it can be used as a metric for comparison of CC mechanisms and as a measure of CC load on DDBMS resources. We also describe two new nonblocking distributed concurrency control mechanisms which use the concept of multiple data object versions. One is based on time stamp ordering of transaction execution and the other is based on nonserializable execution detection and recovery to serializable execution. We compare both with distributed two-phase locking. (Author)

Compilation of Nonprocedural Specifications into Computer Programs.
Technical rept.,
N. S. Prywes, and A. Pnueli. 1 Apr 81, 85p
Contract N00014-76-C-0416

The article describes the compilation of a program specification written in the Very high Level nonprocedural MODEL language into an object (PL/I or Cobol) procedural language program. Nonprocedural programming languages are descriptive and devoid of procedural controls. They are therefore easier to use and require less programming skills than procedural languages. First, the MODEL language is briefly presented and illustrated. An important phase in the compilation process is the representation of the specification by a dependency graph denoted as array graph which expresses the interdependency between statements. Two classes of algorithms which utilize this graph representation continue the compilation process. The first class checks various completeness, non-ambiguity and consistency aspects of the specification. Upon detesting any faults the system attempts some automatic correcting measures which are reported to the user. Alternately when no feasible corrections are possible it reports an error and solicits a user modification.

Operational Survivability in Gracefully Degrading Distributed Processing Systems.
Technical rept.,
Edith Waisbrot Martin. Dec 80, 86p Rept no. GIT-ICS-81/04
Contract N00014-79-C-0231

A simulator was designed and developed which will model possible distributed system network topologies, distributed system application topologies and their effect on application system performance as the configuration of the distributed system network is continuously and arbitrarily reduced. The objective of the model is to aid in development of a measure of survivability which can subsequently be used to evaluate and compare alternative distributed system designs for specific battlefield applications.

Research Program in Fully Distributed Processing Systems.
Quarterly progress rept. no. 6, 1 Dec 80-28 Feb 81,
Mar 81, 14p
Contracts N00014-79-C-0873, F30602-78-C-0120 Sponsored in part by Contracts DAAG29-79-C-0155, DAAK70-79-D-0087 and Grants NSF-MCS77-28305.

The Georgia Tech Research Program in Fully Distributed Processing Systems is a comprehensive investigation of data processing systems in which both the physical and logical components are extremely loosely coupled while operating with a high degree of control autonomy at the component level. The definition of the specific class of multiple computer systems being investigated, and the operational characteristics and features of those systems is motivated by the desire to advance the state-of-the-art for that class of systems that will deliver a high proportion of the benefits currently being claimed for distributed processing systems. The scope of individual topics being investigated under this program ranges from formal modeling and theoretical studies to empirical examinations of prototype systems and simulation models. Also included within the scope of the program are areas such as the utilization of FDPS's and their interaction with management operations and structure.

Performance Analysis of an Optimum Detector with Counting Point Process Observations,
Aurel A. Lazar, and Stuart C. Schwartz. Oct 80, 9p
Contract N00014-80-C-0530
Prepared in cooperation with Columbia Univ., New York. Presented at the Annual Allerton Conference on Communication, Control, and Computing (8th), 8-10 Oct 80.

Tranformations of the classical hypothesis testing problem with continuous-time observations to a hypothesis testing problem with counting point process observations are considered. A general form for the random intensity rate (RIR) which can accommodate feedback is investigated and the optimal solution in the Neyman-Pearson sense is specified. An analysis of the performance of the corresponding optimum processor is studied. (Author)

Statistical Measures of Software Reliability,
Richard A. DeMillo, and Frederick G. Sayward. Oct 80, 24p Rept no. GIT-ICS-80/10
Contract N00014-79-C-0231
Prepared in cooperation with Yale Univ., New Haven, CT. Dept. of Computer Science.

Estimating program reliability presents many of the same problems as measuring software performance and cost: the central technical issue concerns the existence of an independent objective scale upon which may be based a qualitative judgement of the ability of a given program to function as intended in a specified environment over a specified time interval. Several scales have already been proposed. While these concepts may have independent interest, they fail to capture the most significant aspect of reliability estimation as it applies to software: most software is unreliable by these standards, but the degree of unreliability is not quantified. A useful program which has not been proved correct is unreliable, but so is, say, the null program (unless by some perversity of specification the null program satisfies the designer); an operationally meaningful scale of reliability should distinguish these extremes. In the sequel, we will sketch the outlines of the traditional theory that is most relevant to software reliability estimation, give a brief critical analysis of the use of the traditional theory in measuring reliability, and describe another use of the R(t) measure which we believe more closely fits the intuitive requirements of the scale we asked for above.

Application of Discriminant Analysis Techniques to G-Stress Analysis in Computer Voice Decoding.
Master's thesis,
Nadine E. Levine. Dec 80, 75p Rept no. AFIT/GCS/EE/80D-11

The Statistical Package for the Social Sciences (SPSS) Discriminant Analysis Routines were applied to speech data obtained at various gravity levels. The data were created on the Air Force Medical Research Lab's Centrifuge at Wright-Patterson Air Force Base. They were then digitally sampled and Fourier transformed to 64 frequency bands which were converted to two separate files; one the 16 frequencies used by Guyote and Sisson; one the 19 frequencies used by Threshold Technology, Inc. These files were then further processed: summing the energy across time slices, summing across frequency bands, and averaging across frequency bands. Statistical results showed that G-Stress seemed to be moving energy across time slices, more than shifting across frequencies. (Author)

DoD Research Program in Robotics.
Final rept.,
John M. Vranish. 10 Sep 80, 14p Rept no. NSWC/TR-80-325

This paper is a broad, brief overview of the DoD Research Program in Robotics. It begins with background examples on some of the needs and current robotic techniques being used in DoD activities. It then discusses near future robotic systems currently projected for funding. Next, projections are made for the more far-term future DoD robotic systems. Finally, specific areas requiring research are delineated and Navy research programs are identified which address these areas. (Author)

Nested Transactions: An Approach to Reliable Distributed Computing.
Doctoral thesis,
John Eliot Blakeslee Moss. Apr 81, 182p Rept no. MIT/LCS/TR-260
Contract N00014-75-C-0661, Grant NSF-MCS79-23769

We examine how to program a system so that the software continues to work in the face of a variety of failures of parts of the system. The design presented uses the concept of transactions: collections of primitive actions that are indivisible. The indivisibility of transactions insures that consistent results are obtained even when requests are processed concurrently or failures occur during a request. Our design permits transactions to be nested. Nested transactions provide nested universes of synchronization and recovery from failures. The advantages of nested transactions over single-level transactions are that they provide concurrency control within transactions by serializing subtransactions appropriately, and that they permit parts of a transaction to fail without necessarily aborting the entire transaction. The method for implementing nested transactions described in this report is novel in that it uses locking for concurrency control. We present the necessary algorithms for locking, recovery, distributed commitment, and distributed deadlock detection for a nested transaction system. While the design has not been implemented, it has been simulated. The algorithms are described in a formal notation in an appendix, as well as narratively in the body of the report.

Stanley A. White. Feb 81, 66p C80-702/501, AFWAL-TR-80-1208
Contract F33615-79-C-1905

The generic signal-processing equations were analyzed and two specific architectures were evolved for the efficient implementation of these equations. The first architecture which was considered consisted of a set for four arithmetic sections. Each section was capable of combining a pair of 4-element vectors, 16 bits per element, using distributed arithmetic. The second architectural design was pursued which consisted of a single arithmetic section. Input word lengths are limited to 8 bits, 2's complement. Coefficients are variable. The output is full precision. Input data (x's) may be loaded in parallel sequentially, or in parallel 3 at a time; or serially 1, 3 or 9 at a time. The device can be programmed to function as a sliding window, a transversal filter, or a vector multiplier. Multiple devices may be chained together to increase computational accuracy or to extend filter lengths beyond 9 taps.

A Functional Level Preprocessor for Computer Aided Digital Design.
Master's thesis,
Peter G. Raeth. Dec 80, 200p Rept no. AFIT/GCS/EE/80D-12
Availability: Microfiche copies only.

While good gate level and register transfer level digital simulators exist, one can not easily integrate the two due to their inherent limitations. A given simulation can not be described partially in gate level and partially in a higher level. A solution is to create a functional level preprocessor and a library of functional device models linked to a gate level simulator's input language. This permits the mixing of behavioral models with gate level models in the same system structure. The combination of processes (element models or primitives) and their structure (interconnections) can be exercised all at one time during a single simulation session. Two separate pieces of software were written to implement a specific solution to the above situation. SISL (Structural Interface to the Salogs Language) was created. This is a functional level preprocessor to SALOGS (SAndia LOGic Simulator) which is an eight-state, MOS, gate level digital systems simulator. SISL will accept functional level systems descriptions and convert them to a form acceptable to SALOGS. The other effort was the building of a functional level modeling library. This library consists of three behavior models: a 4-16 decoder, a 2048 X 8 ROM, and a 256 X 8 RAM. These

models are designed to be used in a functional level/gate level model of a digital system and will link to the SALOGS run time system. Together SISL and the modeling library provide the easy use of the top-down approach to digital system design.

Microcode Development System for the Micro-programmable Minicomputer Emulator (MiME).
Master's thesis,
Glenn H. Carroll. Dec 80, 65p Rept no. AFIT/GE/EE/80D-12

This report covers the continuing efforts to develop the Microprogrammable Minicomputer Emulator (MIME) into a more flexible and user oriented machine. This consisted of the development of a Microprogram Development System for the MIME as well as hardware enhancements. The amount of writable control store was increased and the ability to load and dump control under program control was added. An LSI-11 microcomputer was added to the system to allow the user to communicate with the other computers in the system, and to transfer files from one computer to another. Several software tools were also produced: (1) a program to semi-automate the generation of the punched cards used to document the MIME's hardware configuration, (2) an executive that runs on the LSI-11 to communicate with the other computers and the user, and to transfer the microcode files, and (3) updating the MIME Modest Monitor to communicate on a higher level and add several new features.

Preliminary Design and Implementation of an Ada Pseudo-Machine.
Master's thesis,
Alan R. Garlington. Mar 81, 121p Rept no. AFIT/GCS/MA/81M-1

This project involved defining an Ada pseudo-machine and developing an Ada to pseudo-code test translator. The translator's front end incorporates a table-driven parser that can parse the entire proposed-standard Ada language. The translator's semantic routines allow integer data objects, several control structures, procedures, functions, packages and tasks. These routines generate pseudo-code that is executed by an interpreter program included in the translator. The interpreter constitutes a complete description of the pseudo-machine whose architecture consists of multiple, stack-oriented processors that access a common memory. Interesting features of the project include the hash-coded symbol table that supports Ada's visibility rules and the pseudo-machine architecture that supports Ada's tasking. (Author)

Construction of a General Purpose Command Language for Use in Computer Dialog.
Master's thesis,
Wayne D. Griess. Sep 80, 200p Rept no. AFIT/GCS/EE/80S-15

Two computer programs were developed and implemented to enable intercommunication between a Data General NOVA/ECLIPSE computer system and another modem linked computer system. One program, called TTERMOP, allows a user to sit at a NOVA terminal and interact with a connected system in a transparent mode. The other program, called MONITOR, is a command language interpreter that examines and executes instructions contained within an action file. An action file, consisting of instruction strings and associated control parameters, is designed to be dependent upon a connected system with regard to contents, yet independent of such a connected system with regard to structure and format. The interpreter is written in FORTRAN IV with FORTRAN and assembly language modules. Actual implementation of the programs is accomplished between the NOVA/ECLIPSE and the Aeronautical Systems Division Control Data CYBER computer system. ASCII data files between 20 and 35,000 bytes have been transferred between the two interconnected systems, each transfer initiated by a single string command acceptable to the interpreter and compatible with a tailored action file for the CYBER system. The programs were designed to be flexible enough for use with several different connected systems, and general enough to be hosted on a system other than the NOVA/ECLIPSE.

Design of a Local Computer Network for the Air Force Institute of Technology Digital Engineering Laboratory.
Master's thesis,
Williams C. Hobart, Jr. Mar 81, 323p Rept no. AFIT/GE/EE/81M-3

A local computer for the Air Force Institute of Technology Digital Engineering Laboratory was designed and the network command language interpreter modules were implemented. The requirements for this network were specified by interviewing nine faculty members associated with the Digital Engineering Laboratory and then translating their functional requirements into a detailed set of hardware and software system requirements. Structured Analysis was used to produce a structured specification for the applications, host-to-host, network, and link protocol requirements. Yourdon and Constantine's Transform Analysis and Transaction Analysis techniques were then used to develop a set of module structure charts for the software design. The network uses a loop topology for the software design. The network uses a loop topology for the nodes with a star of up to four hosts connected to each node. The nodes are implemented using a Universal Network Interface Device (UNID) developed at the Air Force Institute of Technology. Initially, the network will include an Intel Series II Microcomputer Development Station, a Digital Equipment Corporation VAX-11/780, and a Data General Nova.

Contract F33615-79-C-1763

The objective of this 12-month exploratory development was to develop a general-purpose, digital, large-scale integrated circuit device, called the programmed image-processing element (PIPE), which can be programmed to perform a variety of signal-processing functions such as Cosine and Hadamard transforms, edge extraction, unsharp masking, pole-zero filtering, and signal smoothing. The PIPE devices can operate on 8 x 1 or 3 x 3 element data blocks. The PIPE LSIC is suited for those airborne applications where data rate, size, power, and weight restrictions prohibit the use of general-purpose microprocessors or high-speed digital multipliers. This article adresses only the design and photomask fabrication of the PIPE LSIC. During the design phase of the program, several architectures were investigated as candidates for implementing the PIPE LSIC. The read-only-memory (ROM)-accumulate architecture was selected, which maximizes flexibility in algorithm implementation and minimizes external control and timing logic. Investigations of ROM technologies and designs to ensure a user-oriented image-processing LSIC were conducted. The N-channel metal-oxide-semiconductor (NMOS) technology was selected to implement the PIPE LSIC because it is an established, cost-effective technology capable of providing the high-circuit density and low speed-power product. The user-erasable, programmable memory (EPROM) was judged to be the best memory technology to meet the goals of the PIPE LSIC. The PIPE LSIC design completed during this contract has five major sections: input latch/parallel-to-serial shift register, EPROM, shift-and-accumulate, tri-state output latch, and controller.

Design of an Interactive Input Graphics System Based on the ACM Core Standard.
Master's thesis,
Harold Leon Curling, Jr. Dec 80, 109p Rept no. AFIT/GCS/EE/80D-6

A design has been developed for the interactive input section of a graphics system based on the ACM/SIGGRAPH CORE standard of 1979. The input system has been designed for use on a Digital Equipment Corporation VAX 11/780 computer within the VAX/VMS operating system and contains the design for a device driver for the Tektronix 4014 graphics terminal. The design is readily expandable to include software drivers for other graphics devices. The Warnier-Orr diagram method of software design has been used as the vehicle for the development of the design. Three dimensional functions, the STROKE logical device and asynchronous event generation and data access are not supported by the design. However, all input functions required by the CORE standard have been included in the design. (Author)

Jovial (J73) to Ada Translator System.
Master's thesis,
Richard L. Brozovic. Dec 80, 101p Rept no. AFIT/GCS/EE/80D-5

In recent years the Air Force has developed a standard programming language, J73, for use in embedded computer systems. Now that the Air Force has a considerable investment in systems that are currently being developed with J73, the Department of Defense has selected a high order programming language, Ada, that will become the standard for programming embedded computer systems throughout the Department of Defense. Also under development is the definition of a support environment for Ada. One of the tools of this support environment should be a translator that

will produce Ada source programs from J73 source programs. The subject of this research project was the design and development of a Jovial (J73) to Ada Translator System (JATS). The resulting system accepts J73 programs and produces equivalent Ada programs to the extent possible while identifying segments of J73 code that were not translated. This project made use of language parsing techniques and various data structures to support the translation process. Several problem areas are identified with possible solutions. The translator system should be a useful tool in the transition from J73 to Ada. (Author)

Secondary Storage Methods for Solving Symmetric, Positive Definite, Banded Linear Systems.
Doctoral thesis,
John Richard Perry. Apr 81, 88p Rept no. RR-201
Contracts N00014-76-C-0277, F49620-77-C-0037

The solution of a linear system of equations $Ax=b$ is often computed using variations of Gaussian elimination. A major problem with these methods is the large storage requirement to compute the factorization of matrices that arise in practice. We focus on the Cholesky method for factoring banded, symmetric, positive definite matrices, which arise in finite-difference and finite-element simulations. We develop and analyze methods for using secondary storage in cases where there is not enough primary memory to compute the band Cholesky factorization. Many computer configurations used for scientific computation allow for control over the parallel execution of I/O and computation. For several of the secondary storage methods, we present storage and I/O schemes that allow I/O to be overlapped with computation. We derive conditions under which the factorization is compute-bound, i.e., all I/O between the initial input and the final output is completely hidden behind concurrent computation. Further, we show that the amount of memory needed to achieve compute-boundedness is independent of the size and bandwidth of the matrix. Thus, for a given processor speed and I/O rate, a constant amount of memory is sufficient to keep the processor busy during the band Cholesky factorization.

Markov Models for Multiple Bus Multiprocessor Systems.
Final rept.,
Marco Ajmone Marsan, and Mario Gerla. Feb 81, 93p Rept nos. UCLA-ENG-8203, CSD-810304
Contract N00014-79-C-0866

Markovian models are developed for the performance analysis of multiprocessor systems intercommunicating via a set of busses. The performance index is the average number of active processors, called processing power. From processing power a variety of other performance measures can be derived as dictated by the specific processor application. Exact models are first introduced, and are illustrated with a simple example. The computational complexity of the exact models is shown to increase very rapidly with system size, thus making the exact analysis impractical even for medium size systems. To overcome the complexity of computation, several approximate models are introduced. The approximate results are compared with the exact ones and found to be surprisingly accurate for a wide range of configurations. Simulation is used to validate the analytic models and to test their robustness. (Author)

Contracts DAAG29-80-C-0120, N00014-79-C-0231

A set of mutants of a program P, M(P), is a finite subset of the set of all programs written in the language of P, and EM(P) is the set of programs in M(P) which are (functionally) equivalent to p. For a set of test data T, DM(P,T) is the set of programs in M(P) which give results differing from P on at least one point in T. As described elsewhere, it is possible to choose the function M so that ms $(P,T) = 1$ only if T demonstrates the correctness of P with high probability. This paper is a case study of four test data generation schemes. For a fixed program P, five sets of test data are generated and mutation scores are calculated using the FMS.2 mutation system. Since each set has a score less than one, the FMS.2 system is used to derive a set T such that $ms(P,T)=1$.

Interim rept. Oct 79-May 81,
Marshall B. Faintich, Paul C. Figura, and E. W. Quinn. 22 Jun 81, 21p

The primary objective of the digital sensor simulation investigations being conducted at the Defense Mapping Agency (DMA) is to establish an editing and analysis capability for the digital culture and terrain data bases. For purposes of quality control and data base applicability investigations, DMA has developed the Sensor Image Simulator (SIS), a very high speed data base edit station and static scene simulator that allows for interactive query and manipulation of individual features in the data base displays and/or simulated sensor scenes to determine the corresponding data base elements responsible for the simulated features. The SIS was installed at DMA in 1981, and is designed to play a key role in determining the applicability of prototype data bases for use in advanced training simulators, as well as to ensure the quality of, and coherence between, the various digital data bases prior to new data insertion into the master cartographic data base files. Speakeasy User's Manual.
G. C. Hynes. May 81, 87p BDX-613-2569
Contract AC04-76DP00613
Microfiche only after original copies are exhausted.

Speakeasy is an easy-to-use system of programs to manipulate primarily numerical and mathematical data for problem solving. Users access the

Speakeasy system through the IBM VM370 computer. By using language similar to standard mathematical notation and operations common to other computer disciplines, a user can formulate complex problems descriptively. This manual outlines basic operations that can be applied to many types of problem solving. A divider page outlines related functions within each section. (ERA citation 06:024822)

Contract W-7405-ENG-26
Microfiche only after original copies are exhausted.

This report contains information about available numerical routines designed to assist computer users in the solution of scientific problems. The report is organized by problem area. In each area the subroutine libraries NAG, IMSL, and HARWELL have been ranked according to how satisfactory their routines are for the problem area. This ranking is intended only to provide users with an initial order in which to search the subroutine libraries. Whenever possible, each area also contains a list of additional routines that serve to augment the capabilities of the above subroutine libraries. These routines are described in detail and, where appropriate, advice is given on their correct use. Information on how to access the routines and the subroutine libraries at Oak Ridge is provided in a series of appendices. (ERA citation 06:024828)

Distributed Computing Gateway (DCG) Conceptual Design.
R. C. Hall, D. A. Harvey, and J. E. Jensen. Apr 81, 43p SAND-81-0862
Contract AC04-76DP00789
Microfiche only after original copies are exhausted.

Several modifications to the Sandia National Laboratories' current scientific Central Computing Facility (CCF) are planned. These modifications include development of a Central Computing Network (CCN) and a dispersed Distributed Computing Network (DCN). It is necessary to develop a gateway between thse two networks. This connection will permit distributed processors in the DCN to gain access to the data link, various support nodes, and the worker computers in the CCF. This document describes the conceptual design for the required gateway. It provides a general description of the hardware and software necessary to implement the gateway. (ERA citation 06:024829)

User's Guide to ANYOLS: a Flexible Stepwise Regression Program.
C. L. Atwood. May 81, 71p
Contract AC07-76ID01570

ANYOLS is a stepwise regression program. It fits data using ordinary or weighted least squares. It selects the variables to put into the model in a stepwise way, based on F, s exp 2 , MSE (based on C/sub p/), PRESS, or a user-written subroutine. The user can define forcing priorities to influence the order of entering variables. Instead of stepwise selection, the program can also try all possible combinations of any desired subset of the variables. Automatic output for the final model in a stepwise search includes plots of the residuals, studentized residuals, and leverages; if the model is not too large, the output also includes partial regression and partial leverage plots. A data set may be re-used so that several selection criteria can be tried. Flexibility is increased by allowing the substitution of user-written FORTRAN subroutines for several default subroutines. The program is written in CDC FORTRAN 4. (ERA citation 06:022973)

Event-Analysis Language for High-Speed Data Acquisition.
R. A. Hardekopf, R. V. Poore, J. W. Sunier, M. Neiman, and A. Holm. 1981, 6p CONF-810523-2
Contract W-7405-ENG-36
Topical conference on computerized data acquisition in particle and nuclear physics, Oak Ridge, TN, USA, 28 May 1981.

A multiparameter data-acquisition program is described that is highly flexible and yet provides optimum machine code for each individual set of sorting conditions. An Event Analysis Language (EVAL) compiler allows the user full control over the handling of events and produces code which runs 4 to 6 times faster than a generalized program. This technique has been integrated into the Los Alamos Physics Division data acquisition system for high-speed sorting of a wide variety of input data from CAMAC or magnetic tape. The EVAL compiler is written in FORTRAN for MODCOMP computers, but can be easily modified for other systems. (ERA citation 06:024825)

Specifications and Test Methods for Numeric Accuracy in Programming Language Standards.
Final rept.,
John V. Cugini. Jun 81, 42p NBS-SP-500-77, NBS/SP-500-77
Library of Congress catalog card no. 81-600056.

The publication formulates language-independent and machine-independent criteria for assessing the quality of floating-point arithmetic operations and functions. The criteria require that results be within the limits generated by perturbing the arguments or operands by a specified amount, and thus allow for the mathematical instability of some functions at certain arguments and also for the granularity of numeric representation inherent in digital machines. Automatic test methods derive naturally from the accuracy requirements. Model algorithms for testing are included.

Verification of Timing Constraints on Large Digital Systems.
T. M. McWilliams. 7 Apr 80, 10p CONF-800622-2(Rev.1)
Contract W-7405-ENG-48
17. design automation conference, Minneapolis, MN, USA, 23 Jun 1980.

A new approach to the verification of the timing constraints on large digital systems has been developed. The associated algorithm is computationally very efficient, and provides early and continuous feedback about the timing aspects of synchronous sequential circuits as they are designed. It also provides means for conveniently verifying the design in sections, permitting the section-by-section timing verification of designs which are too large to examine as a unit on existing computer systems. A system using this algorithm has been implemented, and has been used to verify the timing constraints on the design of the S-1 Mark IIA processor. (ERA citation 06:022981)

Computer-Aided Design Drafting/Manufacturing (CADD/M) Facility Preparation.
F. J. Norton. 23 Sep 80, 16p CONF-8009151-4
Contract W-7405-ENG-48
Annual ADUA meeting, Denver, CO, USA, 30 Sep 1980.

Computer-Aided Design, Drafting and Manufacturing (CADD/M) equipment requires careful facilities preparation before installation takes place. This paper presents what a company should consider to ensure a proper installation. This includes consideration of working conditions. To get the most out of the system, the operators must be provided with a relaxed, comfortable environment, free from noise and other distractions. Such things as temperature requirements, lighting, power, security and fire protection are discussed. Also, future expansion needs are considered so that major construction will not be required for future years. Advanced planning in these areas is needed to ensure successful implementation of a CADD/M system. This will lead to considerable cost savings, and in the long run, improve the scheduling for an entire project, from initial design to final production. This careful preparation will minimize unplanned events and problem areas. These are ambitious goals but easily realized if a logical and rational plan is adopted in the same manner as that used in a typical development program. (ERA citation 06:022982)

Selecting and Implementing an Interactive Computer Aided Design Drafting/Manufacturing (CADD/M) System.
F. J. Norton. 23 Sep 80, 54p CONF-8009151-3
Contract W-7405-ENG-48
Annual ADUA meeting, Denver, CO, USA, 30 Sep 1980.

Success with Interactive Computer-Aided Design Drafting/Manufacturing (CADD/M) depends upon management, users, and the system itself. If you are in a design and drafting environment, the thought of acquiring a CADD/M system will probably occur to you sometime in the very near future - if it hasn't already. Convincing yourself and your management of the benefits of such systems is but the first step. Evaluating and selecting one particular type of CADD/M system can turn out to be a complicated undertaking - not to mention somewhat frustrating. Procedures for selecting and successfully implementing a CADD/M system are outlined. INITIAL PREPARATION examines the techniques used to evaluate CADD/M systems including formation of an evaluation team, and application analysis. GRAPHICS EVALUATION describes

the methods that can be used to test a CADD/M system, including benchmark drawings and specifications, human engineering considerations, and other evaluation criteria and general system configurations are also discussed. COMPUTER SYSTEM EVALUATION examines other factors in systems selection: programming, communications, documentation, and service. SYSTEM STARTUP addresses site preparation, people preparation, system acceptance, and operator, designer/drafter selection. Finally, operator, designer/drafter TRAINING and SYSTEM MANAGEMENT are discussed. This systematic approach wil help those contemplating the acquisition of CADD/M systems for their activities and will help minimize unplanned events and problem areas.Advanced planning in these areas is needed to ensure successful implementation of a CADD/M system. This in turn will lead to considerable cost savings and schedule improvements for an entire project, from initial design to final production. These are ambitious goals but easily realized if a logical and rational plan is adopted in the same manner as that used in a typical development program. (ERA citation 06:022983)

Cost Justification for an Interactive Computer-Aided Design Drafting/Manufacturing System.
F. J. Norton. 23 Sep 80, 23p CONF-8009151-2
Contract W-7405-ENG-48
Annual ADUA meeting, Denver, CO, USA, 30 Sep 1980.

Many factors influence the capital investment decision. System costs and benefits are weighed by methods of financial analysis to determine the advisability of an investment. Capital, expense, and benefits as related to Interactive Computer-Aided Design Drafting/Manufacturing (CADD/M) Systems are discussed and model calculations are included. An example is treated by the simple payback method and the more sophisticated methods of Net Present Value (NPV) and Internal Rate of Return (IRR). The NPV and IRR approaches include in the calculation the time value of money and provide a sounder foundation on which to base the purchase decision. It is hoped that an understanding of these techniques by technical personnel will make an optimum system purchase more likely. (ERA citation 06:022984)

Effects of a Pulse-Forming Network Operating into a Non-Linear Load.
Master's thesis,
Edward Jacob Keefer, Jr. 15 Mar 81, 76p Rept no. AFIT/GE/EE/81M-4

The power modulator of an electron-beam gun was computer modeled to investigate the performance of a pulse-forming network (PFN). The PFN was designed for a constant matched load but operated into non-linear load. The power modulator's operation consisted of: pulsing the electron-beam gun's cathode to a negative 220KV, thru a pulse transformer, by a 50KV hard-tube pulser, this pulser was switched by four parallel power triodes, which were driven by a line type pulser or PFN. The triodes, the PFN's load, exhibited a non-linear impedance dependent on their grid and plate voltages. The computer model was used to examine the effects of the non-linear load of the power tubes on the PFN. The PFN as constructed in four; 12KV, 10 sec modules. It was possible to add or remove these modules from the PFN to change the pulse width in 10 sec steps. This modular PFN design was first investigated using a digital computer model and then built and tested for a constant load. Then the effect of operating into a non-linear was examined by modeling the PFN within the power modulator. (Author)

Effect of Electrical-Utility-System Voltage Harmonics on Induction Motors.
N. E. Rasmussen. Mar 81, 6p
Contract AC02-76ET20279

Distortion of the electrical utility system voltage waveform can result in damage to or malfunction of user electrical equipment. An experiment was carried out to determine the effect of utility voltage harmonics on the temperature rise of single-phase induction motors. The results suggest that utility voltage harmonics do not significantly affect the operating temperature of a single-phase induction motor until the amplitudes of the harmonics are much larger than the amplitudes currently present in the US utility system. Statistical Characteristics of Power Spectrum Estimates Derived from Higher Resolution FFT'.
Technical rept.,
Clark S. Penrod. 21 May 81, 109p Rept no. ARL-TR-81-26
Contract N00039-79-C-0306

This report documents an investigation of the properties of a technique used to reduce the resolution of a power spectrum estimate. The technique investigated is the familiar one in which averaging across frequency is performed on a spectrum estimate to produce an estimate which has less resolution, but improved stability. Results are presented in various areas. Primarily, the statistical nature of a reduced resolution spectrum produced in this way is characterized by the derivation of expressions for equivalent degrees of freedom. In addition, the associated spectral windows are determined, and examples are shown which illustrate the effect on the spectrum estimate of various uniform and non-uniform weighting schemes in the frequency averaging. Finally, a particular weighting scheme is shown which produces results which closely approximate the lower resolution estimate obtained by conventional means with the Hanning window. (Author)

A Nonlinear Maximum Entropy Method for Spectral Estimation.
Final rept. 1 Mar 80-30 Apr 81,
C. H. Chen. 30 Apr 81, 50p SMU-EE-TR-81-8, AFOSR-TR-81-0528
Grant AFOSR-80-0143

An intensive research study is made of the nonlinear maximum entropy spectral analysis method proposed by P.F. Fougere of AFGL. The research not only provides a much better understanding of the properties of the method including spectral resolution, convergence, etc. but also shows that the method can be performed effectively with the PDP 11/45 minicomputer. The successful implementation of the method is described in the program listings in Appendix I. Extensive computer results are presented on various data. These results clearly confirm that the nonlinear method is superior to the Burg's maximum entropy spectral analysis. Preliminary results on the multichannel (multivariate) maximum entropy spectral analysis, the two-dimensional maximum entropy spectral analysis, and computer graphics for the spectral display are also presented. An extensive bibliography of the maximum entropy spectral analysis is given in Appendix III. (Author)

Eigenfunctions of Hermitian Iterated Operators with Application to Discrete and Continuous Radiating Systems.
Technical rept.,
Naoki Inagaki, and Robert J. Garbacz. Jan 81, 41p Rept no. ESL-712695-1
Contract N00014-78-C-0049

In this report we study some properties and applications of Hermitian operators formed by the iteration of any given operator with its adjoint. Such a given operator might arise in array and aperture antenna theory and, as shown in examples, the eigenfunctions of the corresponding Hermitian iterated operator can be used to maximize power transferred from an array to a point, or from one aperture to a second aperture. Constraints, such as a normed power source radiating into a specified sector of space, may be incorporated into the theory as well, as illustrated by an example. The eigencurrents and fields of Hermitian iterated operators associated with perfectly conducting bodies are introduced and contrasted with the characteristic currents and fields of Garbacz, Harrington, and Mautz.

Contract N00014-78-C-0613

In the past several years, there has been widespread interest in a variety of wave generation devices based on un-neutralized beams of relativistic or mildly relativistic electrons. Such devices are potentially capable of producing high power, with high efficiency, in the centimeter, millimeter, and sub-millimeter spectral ranges. An example is the electron cyclotron maser, which has produced approximately 100 kW at centimeter wavelengths, with efficiencies ranging from 30% - 50%. The gyrotron mechanism involves azimuthal phase bunching of the electron beam, which occurs during resonant interaction of the Doppler-shifted beam cyclotron mode with a waveguide or cavity mode. The bandwidth of the gyrotron mechanism is typically of order 1-2%. For various military and communications applications, it could be of great interest to develop free-electron amplifiers with wide operating bandwidths. In this report, we present a linear analysis of a new principle for wideband amplification. The basic configuration is the use of an annular electron beam drifting in a dielectrically-loaded waveguide. In such a waveguide, the normal guide modes have phase velocities asymptotic of the speed of light the square root of the dielectric constant. The system is assumed to be immersed in an axial magnetic field sufficiently strong to render the motion of the beam electrons one-dimensional. In this case, the amplification mechanism depends on axial charge bunching in the Cerenkov interaction of a longitudinal space-charge wave of the beam with the Ez - component of a TM guide mode.

Conformal and Small Antenna Designs.
Technical rept.,
Howard S. Jones, Jr. Apr 81, 32p Rept no. HDL-TR-1952

Select antennas are described that can be used effectively on conformal surfaces. Most of these antennas are compact, are electrically and physically small, and can be easily integrated into conical and cylindrical bodies. Edge-slot, microstrip, and dielectric rod radiator design techniques are employed in the development of these antennas. Critical design parameters, modes of radiation, empirical data, and theoretical considerations are discussed. The intrinsic properties and characteristics of selected dielectric materials are considered. (Author)

Application of Filters for High-Altitude Electromagnetic Pulse Protection.
Technical memo.,
Gary L. Roffman. Apr 81, 53p Rept no. HDL-TM-81-9
Contract MIPR-HC1001-9-400

The application of filters for the protection of electrical equipment from electrical transient signals induced by high-altitude electromagnetic pulse (HEMP) is discussed, and the application of filters to ac and dc power supplies and analog and digital signal inputs is described. The application of filters is demonstrated for different types of filters; also shown are filter limitations caused by arching, source and load impedance mismatches, saturation, and parasitic reactances. The use of filters following a nonlinear terminal protection device (TPD) is shown to be a very effective means of transient energy reduction. Magnetic cores and ferrite beads can provide a simple method of high-frequency transient suppression. (Author)

Theory of A Wideband Distribution Gyrotron Travelling Wave Amplifier.
Memorandum rept.,
K. R. Chu, Y. Y. Lau, L. R. Barnett, and V. L. Granatstein. 23 Jun 81, 26p Rept no. NRL-MR-4455

We present the concept of an ultra-wideband distributed gyrotron travelling wave amplifier for millimeter and submillimeter waves. The radius of the waveguide in the interaction region is increased along the axis while the strength of the d.c. magnetic field is decreased in such a way that the wave cutoff frequency is kept nearly equal to the electron cyclotron frequency. The basic principle of operation, peak gain, and saturated efficiency are analyzed. It is shown that instantaneous bandwidth over at least two octaves is theoretically possible. Technological requirements for achieving such an amplifier are assessed, including proposed structures for distributed input wave coupling. (Author)

Design of Linear Phase, Finite Impulse Response, Two-Dimensional, Digital Filters.
Master's thesis,
David Ciccolella. Dec 80, 158p Rept no. AFIT/GE/EE/80D-13
Availability: Microfiche copies only.

An interactive computer program was developed that enables the user to design linear phase, finite impulse response, linear shift-invariant, two-dimensional digital filters. The program user can design lowpass, highpass, bandpass, bandstop, all-pass, and multiband two-dimensional digital filters. The filters designed by using the program are nearly optimal in the Chebyshev sense. The technique implemented in the program consists of transforming a one-dimensional digital filter into a two-dimensional digital filter by a change of variables. This technique was first proposed by James H. McClellan and is called the McClellan Transformation. The program user can elect to utilize either the first order or the second order McClellan Transformation to design a two-dimensional digital filter.

Nanosecond-Gating Properties of Proximity-Focused Microchannel-Plate Image Intensifiers.
N. S. P. King, G. J. Yates, S. A. Jaramillo, J. W. Ogle, and J. L. Detch, Jr. 1981, 22p CONF-810429-18
Contract W-7405-ENG-36
Conference on optics, Santa Fe, NM, USA, 6 Apr 1981.

Some fundamental properties of 18-mm-diam gated proximity-focussed microchannel-plate (MCP) image intensifiers used as fast image shutters in the 1 to 10 ns range have been identified and studied. Light pulses (approx. 5 ps wide) from a modelocked dye laser optically sample the gated MCP. Shuttering is achieved by applying a forward-biasing electrical gate pulse to the quiescently reverse-biased photocathode-MCP interface. Variable delay (approx. 30 ps jitter) between the gate pulse and the laser pulse permits tracing the MCP's optical response. Gating speeds, turn-on and turn-off patterns, the asymmetric spatial dependence of the MCP optical response, and resolution effects as functions of gate pulse width and photocathode-MCP bias have been characterized. Shutter times of >750 ps with approx. 5 1p/mm resolution were observed. Variations in the intensity profiles of the phosphor's spatial response for uniform photocathode illumination are measured with a calibrated silicon-intensified-target (SIT) focus projection, scan (FPS) television camera and a high-speed video digitizer while photomultipliers monitor the laser pulse and the phosphor's spatially integrated output intensities. The characterization system, gating and biasing circuits, and experimental results will be presented. (ERA citation 06:022520)

Cylindrical Microwave Lens Antenna for Wideband Scanning Applications.
Patent Application,
Walter Rotman. Filed 23 Feb 81, 34p AD-D008 526/6
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The bandwidth limitation in space fed phased arrays (that results from the use of phase shifters to implement beam steering) is overcome by a lens arrangement in which independent feeds are provided at the focal plane of the lens. Each feed generates a collimated beam in a different spatial direction. Each beam can then be steered about its central position by means of phase shifters, while retaining a substantially improved bandwidth. An algorithm is derived for designing three-dimensional (3D) microwave lenses with line source feeds by stacking a number of identical two-dimensional (2D) parallel-plate, wide-angle constrained lenses into a cylindrical antenna structure. This lens design provides focused beams over a wide range of scan angles in both elevation and azimuth with only small optical aberration. A wide variety of lens designs can be achieved through this algorithm, dependent upon the constraints which are selected for the 2D lens counterpart. For one design, where all the transmission line lengths in the lens are made equal, the phase errors for beam scanning in the plane containing the cylindrical axis of the antenna are less than their broadside values, regardless of scan angle. This permits wide-angle coverage in both elevation and azimuth from a single lens with both good beam and quality and bandwidth. (Author)

Adaptive Feed-Forward System.
Patent Application,
Ronald M. Bauman. Filed 14 Apr 81, 20p AD-D008 552/2
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A feed-forward system is given for reducing the distortion products from a device such as an amplifier, wherein a sample of the device input signal is subtractively combined with a sample of the device output signal to produce a sample of the distortion products. The distortion sample is adjusted in amplitude and phase and subtractively combined with the device output to produce a distortion-reduced system output. A synchronous detector correlates a sample of the system output, in which the proportion of distortion has been increased, with another sample of the distortion products to produce control signals for a modulator which adaptively adjusts the amplitude and phase of the distortion sample subtractively combined with the device output. Active Dielectric Waveguide Amplifier or Oscillator Using a High Density Charged Particle Beam.
Patent Application,
Charles M. DeSantis, and Louis J. Jasper, Jr.
Filed 17 Apr 81, 15p AD-D008 537/3
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A circuitless particle beam device for relatively high frequency amplifier or oscillator applications that eliminates the requirement for an internal RF slow wave structure. A circularly polarized RF energy wave propagates on a relatively high density particle beam within an oversized wageguide and interacts with the beam which exhibits a relatively high dielectric constant. The high density beam acts as an active dielectric waveguide serving the dual purpose of a slow wave circuit and amplification source, and accordingly guides and amplifies the RF energy when a condition of beam and wave synchronism is met. Nagra Behov Samt Foerslag till Arbetsinriktning),
Rolf Helgodt. Aug 80, 25p FOA-C-30198-E1
Text in Swedish, Abstract in English.

The desire or necessity often arises in both military and nonmilitary sectors of modifying existing equipment or designing new devices using highly specialized integrated circuitry. In many cases this proves to be impossible since the design phase is extremely costly and production of over 100,000 pieces would be necessary to justify production economically. This is generally not possible for such diverse purposes as airplanes, rockets, telephone stations, and extremely advanced, specialized measuring devices. The present report examines these problems as they are related to the production of equipment for the Swedish military, as well as for current projects in the United States.

The Pop-Up Buoy (PUB).
Technical rept.,
John M. Dahlen, Narender K. Chhabra, Frank J. Siraco, and William E. Toth. Jun 81, 47p Rept no. R-1480
Contract N00014-75-C-0291

The Pop-Up Buoy (PUB) was conceived as a practical means to implement a real-time telemetry link between a satellite and instruments beneath the ocean surface. It is a self-contained module, tethered to a moored subsurface buoy, and capable of propelling itself up and down between the ocean surface and a submerged rest station. Most of its life is spent submerged, secure from storms and surface traffic, while storing data sent from remote sensors via an acoustic link. At pre-determined times of satellite passage, it rises to the surface for a brief transmission. If a storm is sensed by pressure fluctuations the transmission can be postponed or cancelled. Typical low data rates, e.g., only 3000 bits every 3 days in the acoustic tomography application, can be handled with infrequent transmissions. Energy for propulsion is then so small that a two-year life system may be packaged in a compact unit. A PUB sized for tomography has the form of a 56 cm sphere with small appendages and weighs 104 Kg (230 lbs). The design of this unit is described. (Author)

Electrical Energy Reduction for Army Installations.
Final rept.,
L. M. Windingland. May 81, 65p Rept no. CERL-TR-E-170

This report describes an analysis of electrical energy consumption of selected Army buildings at representative Army installations and of methods that can be used to reduce electrical consumption and associated utility costs at these installations. The report defines various techniques such as power factor correction, lighting reduction, motor voltage controllers, and the benefits derived from their application. The report shows that electrical consumption is significant when the buildings are unoccupied; in fact, the unoccupied consumption, especially in adminstration, maintenance and operations buildings, often amounts to over 60 percent of total annual consumption. It was concluded that a detailed, building-by-building electrical reduction program employing intelligent and more effective use of heating, ventilating, and air conditioning equipment scheduling, motor control, and reduced lighting will provide the most effective electrical consumption reduction. Department of Energy Solar Energy Objectives, Calendar Year 1980.
Apr 80, 33p

This paper sets out the goals of the Department of Energy for calendar year 1980 with respect to the output of each of the solar energy programs authorized by Congress. The paper is organized functionally to describe the solar activities of the Department by the sector of the economy they are designed to serve. The first part sets out an overview of the Department's solar activities including the potential contribution by solar energy, the barriers to be overcome, and an aggregation of the output we expect in the calendar year 1980. The next six parts describe the Department's solar activities aimed at the six major solar-using sectors of the economy: residential, commercial, agricultural, industrial, transportation, and utilities. The eighth part summarizes the United States government's efforts to advance the international trade possibilities in solar energy. The ninth part describes the solar projects that affect more than three of the sectors described in the preceding seven parts. The appendix contains the name and telephone number of the Department of Energy official responsible for achieving each of the quarterly output objectives described in parts II through IX of the paper. The paper covers five categories of solar energy sources: (1) biomass, which includes all uses of renewable organic material either to burn directly or to convert to liquid or gas fuels; (2) solar thermal systems, including active and passive systems for collecting heat from sunlight to be used either for heating or cooling systems; (3) photovoltaic systems, which use cells of semi-conductor materials to convert sunlight directly to electricity; (4) wind-powered systems; and (5) ocean systems including ocean thermal energy conversion, salinity gradients, ocean currents, and wave energy. Solar system owners and their neighbors in the San Francisco Bay Area were studied. The study determined the level of homeowner awareness about residential solar energy systems, described characteristics of consumers purchasing solar equipment (e.g. whether they represent identifiable market segments), identified major channels of communication through which solar information is effectively used, determined remaining barriers to solar use, identified needed incentives to accelerate commercialization, and assessed public attitudes toward various state and Federal government actions to increase the rate of solar energy use statewide. Issues and questions explored are being used in the development of a statewide survey of 700 homeowners in California to determine if these findings apply to residents throughout the state. (ERA citation 06:021737)

Biphase Energy Systems, Santa Monica, CA.
Generation of Useful Energy from Process Fluids Using the Biphase Turbine. Final Report.
N. L. Helgeson. Jan 81, 213p
Contract AC07-76ET15350

The six largest energy-consuming industries in the United States were surveyed to determine the energy savings that could result from applying the Biphase turbine to industrial process streams. A national potential energy savings of 58 million barrels of oil per year (technical market) has been identified. This energy is recoverable from flashing gas-liquid process streams and is separate and distinct from exhaust gas waste-heat recovery. The industries surveyed in this program were the petroleum chemical, primary metals, paper and pulp, stone-clay-glass, and food. It was required to determine the applicability of the Biphase turbine to flashing operations connnected with process streams, to determine the energy changes associated with these flashes if carried out in a Biphase turbine, and to determine the suitability (technical and economical feasibility) of applying the Biphase turbine to these processes. The results of this investigation are reported as: (1) a list of processes to which the Biphase turbine is adaptable, (2) a list of processes indicating the potential plant and national energy savings that could result from applying the Biphase turbine, (3) a list of the processes according to their suitability for application of the Biphase turbine. The results of energy calculations

for 22 processes (out of 383 examined) are given. The process name, type of application, stream and plant size, energy savings per plant, and potential national energy savings(technical market) are provided for each entry. These processes are listed according to their national potential energy savings. Based upon these results a suitability listing was developed which rates the processes according to their technical and economic feasibility. In addition to the potential for energy savings, capital cost, payback period, estimated market penetration, and applicability of current Biphase technology were considered in the development of this listing. Analyzing Opportunities for Energy Conservation in Municipal Fleet Management: Service Delivery Patterns, Equipment, Supply, Operations, and Maintenance. Information Bulletin of the Energy Task Force of the Urban Consortium.
1980, 39p
Contract FG02-78IR05106

Vehicle fleet management as a five-step process is portrayed and the multiple energy conservation opportunities within each step are examined. The five steps described are, configuration of service area and service delivery patterns, equipping the fleet, operating the fleet, maintaining the fleet, and supplying the fleet with fuel. A systems approach to decision making about municipal fleets is outlined. Management options, control techniques, and devices are suggested for each of the five steps. Reference is made to analytic tools which will assist in deliberating options at each of these steps. These tools are presented in a list. Four concise case studies of jurisdictions which are taking deliberate steps to reduce fuel use are presented. Key opportunities for fuel conservation are then summarized, followed by a selected bibliography, and listing of reference materials and additional resources. (ERA citation 06:022226)

Energy Conservation Manual: A Guide for Local Government Services in Wisconsin.
1979, 110p

A guide is presented to provide local decision makers and administrative personnel with a means to determine their own energy consumption patterns and a means to develop energy conservation measures in their day-to-day activities. Chapter I presents a description of the program which selected a sample of Wisconsin communities to determine their energy consumption patterns and identify priority areas for implementing energy conservation methods through the use of this guide. Chapter II provides an outline of steps on how to begin or organize a program for energy conservation. Chapter III presents a checklist of energy conservation measures by energy type and by use. Each measure was evaluated by the sample communities in terms of its potential for implementation. Chapter IV discusses the implementation efforts of the participating communities in terms of problems, difficulties, and successes of certain conservation measures. A series of appendices are included which provide samples of memorandums, resolutions, analysis procedures, technical data, etc., to assist in the details of establishing an energy conservation program and in the selection of conservation methods which are appropriate for a specific situation. New England Energy Congress, Somerville, MA.
Strategy Papers Prepared by the Implementation Group of the New England Energy Congress.
Jul 80, 155p

Over the nine months prior to release of this report, a 55-member task force worked at developing strategies and program initiatives to implement the New England Energy Congress' Blueprint for Energy Action, released in June 1979. Prepared for the bi-partisan, six-state New England Congressional Caucus, the Blueprint was the result of a first in the national effort to formulate a regional energy plan. Comprised of representatives of eleven constituencies ranging from environmental organizations to industry to state and Federal agencies, the Implementation Group of the Energy Congress divided itself into five working committees: (1) Wood, Solid Waste and Peat, (2) Electric Issues, (3) Conservation, Solar and Low Income, (4) Oil, and (5) Natural Gas, Coal, and Synfuels. Each committee developed strategy papers and program initiatives, which were reviewed by the full Implementation Group, and are presented here. Although the formal deliberations of the Energy Congress are now complete, the goals developed by the group are just beginning to be fulfilled. Initiatives in both the public and private sectors have been put into motion to achieve Energy Congress objectives. A number of recently enacted Federal and state laws directly reflect the group's input. (ERA citation 06:022119)

Pipeline Bottoming-Cycle Study Demonstration Program Plan. Task V. Topical Report.
24 Jul 79, 60p
Contract AC03-77CS51381

A study to determine the feasibility of bottoming cycles on natural gas pipelines, using the waste heat from the exhaust gas of the prime movers to provide the additional shaft power and conserve some of the gas used to provide the pumping power, is described. Subsequent phases on the pipeline study are identified and are presented in a formal program plan. Phase II covers the directed studies; Phase III covers the design and construction information; and Phase IV describes system startup, operation, and data acquisition and analysis. This report also shows the timing of the various phases of the program. The statement of work in Appendix A describes involvements necessary to make the demonstration of the bottoming cycle equipment possible at a demonstration site. The master schedule for the entire program is presented for the entire program in the main text and the detailed schedule charts, by each task, are presented in the Appendix B. Further, the total estimated cost breakdown for each phase of the program is presented by the task and by the category of the participants. The total cost for the entire program without regard to cost participation is estimated to be around $6.5 million and is planned to take 48 months for the completion. (ERA citation 06:023754)

Model Simplification: A Case Study of End Use Demand Modeling in the Transportation Sector.
A. Ford. 1981, 5p CONF-810701-2
Contract W-7405-ENG-36
Computer simulation conference, Washington, DC, USA, 15 Jul 1981.

The design of a rather simple model of petroleum use by automobiles in the US economy is considered. The model must be simple to allow it to function within a larger end use demand model under construction for use within the FOSSIL2 modeling system. The simple model has been designed so that its behavior under reasonable conditions will resemble the behavior of a much more complex model of the nation's transportation system. The complex model is known as ENTRANS. The model simplification approach described requires a summary of the behavioral response of the more complex model in a form that is readily mimicked by the simple model. The band of uncertainty in the relationships used in the simple model are determined through sensitivity testing of the more complex model. Problems inherent in the model simplification process are discussed in the concluding portion of the paper. (ERA citation 06:022227)

USAF Solar Thermal Applications Overview.
Final Report.
J. S. Hauger, and J. A. Simpson. 4 May 81, 60p
NASA-CR-164481, JPL-9950-546
Contract JPL-955887

Process heat applications were compared to solar thermal technologies. The generic process heat applications were analyzed for solar thermal technology utilization, using SERI's PROSYS/ECONOMAT model in an end use matching analysis and a separate analysis was made for solar ponds. Solar technologies appear attractive in a large number of applications. Low temperature applications at sites with high insolation and high fuel costs were found to be most attractive. No one solar thermal technology emerges as a clearly universal or preferred technology, however,, solar ponds offer a potential high payoff in a few, selected applications. It was shown that troughs and flat plate systems are cost effective in a large number of applications.

Regional Economic and Energy Consumption Implications of the NEP-2 Base Case Scenarios.
D. J. Bjornstad, D. P. Vogt, and D. N. Stuckwish.
May 81, 69p
Contract W-7405-ENG-26

An attempt is made to measure the impact of changes in the national economy on regions of the United States, translated onto a grid of 173 regions, into national employment and energy consumption impacts that result from different prices for imported crude oil. These projections extend to the year 1995. Once calculated, regional economic and energy conditions are examined tabularly and graphically to highlight above and below average inter-temporal change and world oil price-related change. Regions are also classified by initial socioeconomic characteristics to determine if particular types of regions receive systematically different impacts. Although much evidence of systematic change is present at the regional level, the relatively small changes occurring in the national economy do not lead to large regional impacts. This analysis found no disruptive or highly significant regional impacts occurring from the price change assumptions of the scenarios. (ERA citation 06:022121)

Doctoral thesis,
Christine Tourrand-Brosset. 24 Jun 80, 175p
ORDER-692
Text in French.

The shortage of water and of wood for fuel is examined. Two solutions are considered--centralized production and local production--for the problem of supplying energy to the village. Local potentials, in all sources of renewable energy, are inventoried. An assessment is drawn up, showing the potential for local energy self-sufficiency based on use of renewable sources of energy within the village. A model of energy development and consumption was constructed for self-sufficiency in food and energy; ecology, technology, economics and sociology are taken into account.

Data on the output of eight industrial and five service sectors derived from the EXPLOR model, are related to activity indices of production to enable projections to 1985 to be made. The energy efficiency of each of these sectors, i.e. the ratio of consumption to output is presented in several tables based on EXPLOR projections to 1985. Graphs show the relative importance of the different forms of fossil and other energy sources to the sectors and the possibilities for substitution of fuels. The matrix for the transition from EXPLOR to EFOM (energy flow optimization model) is described as well as the resulting computer program EXFOM. Because projections of this transition matrix are dependent on data from an energy demand model, covering industrial and domestic uses, several such models are investigated.

Guy-Cable Design and Damping for Vertical-Axis Wind Turbines.
T. G. Carne. May 81, 35p
Contract AC04-76DP00789

Guy cables are frequently used to support vertical axis wind turbines since guying the turbine reduces some of the structural requirements on the tower. The guys must be designed to provide both the required strength and the required stiffness at the top of the turbine. The axial load which the guys apply to the tower, bearings, and foundations is an undesirable consequence of using guys to support the turbine. Limiting the axial load so that it does not significantly affect the cost of the turbine is an important objective of the cable design. The lateral vibration of the cables is another feature of the cable design which needs to be considered. These aspects of the cable design are discussed in this paper, and a technique for damping cable vibrations is mathematically analyzed and demonstrated with experimental data. (ERA citation 06:021986)

The Effect of Rotor Geometry on the Harmonic Performance of Synchronous Generators.
Master's thesis,
Cecil Stuerke, and David W. Nordquist. Dec 80, 123p Rept no. AFIT/GE/EE/80D-34

The use of rotor geometry as a specification in the control of generator voltage and flux density harmonics is studied. The possibility of generating a specific voltage waveform at the load with only a three-phase rectifier between the AC generator and the load is investigated. The armature reaction MMF is expressed as an infinite set of traveling waves with an infinite set of velocities. It is shown that the rotor MMF cannot cancel armature reaction everywhere because the rotor MMF has only the velocity of the rotor. The MMFs present at all the stator slots of an armature coil group are reflected into a single slot in an attempt to control the air gap flux density harmonics be selectively positioning increments of rotor reluctance. This method fails because a general solution for the reflected flux densities could not be obtained. Specifying the air gap reluctance incrementally as the rotor moves under successive stator slots is also tried as a means of harmonic control. This method proves unworkable due to negative MMF requirements and conflicting geometry specifications. Finite Element analysis is introduced as a computer aid to the design of a magnetic structure. Recommendations for further study are included. (Author)

Prime Power to Pulse Conditioning Interface Methods.
Master's thesis,
Jaime Roberto Silva. Dec 80, 77p Rept no. AFIT/GE/EE/80D-39

AC and DC resonant charging hardware tests were conducted with a 15KW DOD standard 400 HZ generator as prime power. DC resonant charging caused vibrations of the generator at the pulsing frequency and instability of the voltage regulator due to the very irregular generator voltage waveform. The input DC voltage to the pulser sagged causing the performance to be lower than expected. An analysis of this problem and the theory to account for this sag is presented. Problems with the triggering of AC resonant charging were not solved in time for this report. The experimental set up of AC resonant charging is presented. AC resonant charging caused no negative impact on the generator which is a great advantage over DC resonant charging. (Author)

MHD Heat and Seed Recovery Technology Project. Ninth Quarterly Report, January-March 1980.
M. Petrick, and T. R. Johnson. May 80, 34p
Contract W-31-109-ENG-38

The MHD Heat and Seed Recovery Technology Project at Argonne National Laboratory is obtaining information for the design and operation of the steam plant downstream of the MHD channel-diffuser, and of the seed regeneration process. The project goal is to supply the engineering data required in the design of components for prototype and demonstration MHD facilities. The primary effort of the HSR Technology Project at Argonne is directed toward experimental investigations of critical problem areas, such as (1) NO/sub x/ behavior in the radiant boiler and secondary combustor; (2) radiant boiler design to meet the multiple requirements of steam generation, NO/sub x/ decomposition, and seed-slag separation; (3) effects of solid or liquid seed deposits on heat transfer and gas flow in the steam and air heaters; (4) formation, growth, and deposition of seed-slag particles; and (5) character of the combustion gas effluents. These investigations are performed primarily in a 2-MW test facility, Argonne MHD Process Engineering Laboratory (AMPEL). Other project activities are related to studies of the thermochemistry of the seed-slag combustion gas system, identification of ceramic and metallic materials for service in the MHD-steam plant, and evaluation of seed regeneration processes. Progress is described. (ERA citation 06:022142)

Heat-Transfer Scaling Laws for MHD Channels and Diffusers.
R. K. Ahluwalia, and K. H. Im. 1980, 9p
Contract W-31-109-ENG-38
International conference on MHD electrical power generation, Cambridge, MA, USA, 16 Jun 1980.

A quasi-three-dimensional flow model is used to study the convective and radiative heat transfer characteristics of coal-fired MHD channels and diffusers. The radiative contributions of carbon dioxide, water vapor, potassium atoms, and slag particles are all included in the model. The scale-up of heat transfer with the size of MHD channels and diffusers is characterized as an aid to extrapolation of experimental heat transfer measurements. The scale-up of radiation with the channel or diffuser size, centerline temperature, wall temperature, boundary layer thickness, gas pressure, and average size and number density of slag particles is investigated. Generalized plots of gas emissivity and absorptivity are provided for use in estimating radiative heat transfer in MHD channels and diffusers. (ERA citation 06:023676)

Simulation of a Hydraulic Air Ingestion Process.
F. C. Chen, and A. Golshani. 1981, 9p
Contract W-7405-ENG-26
12. modeling and simulation conference, Pittsburgh, PA, USA, 30 Apr 1981.

A hydraulic air ingestion process which requires no mechanical moving parts to accomplish air compression but a downward flow of water and operates at nearly isothermal compression mode can be a viable alternative for the noncondensibles disposal of an OTEC open-cycle power system. A computer simulation of the process is presented based on one-dimensional lumped parameter analysis. Results of laboratory-scale experiments were obtained which compared favorably with the analytical results. A sensitivity study which depicts the effects of various parameters upon the applied head of the hydraulic air ingestion process is also presented. (ERA citation 06:023343)

Contract W-7405-ENG-26
15. IEEE PV specialists conference, Orlando, FL, USA, 11 May 1981.

The results of a study whose purpose was to evaluate the combination of ion implantation followed by pulsed ruby laser annealing (11/PLA), as semiconducting GaAs substrates, are reported. High dose Zn, Mg, Si, and Se implants were used. PLA was carried out in air without encapsulation, and with thin sputtered SiO sub 2 encapsulation layers. The combination of I-V, C-V, scanning elec-

tron microscopy, transmission electron microscopy, and secondary ion mass spectroscopy measurements that were carried out have important implications for photovoltaic applications including the possibility of forming planar junctions, the choice of implanted ions to obtain high electrical activation, the optimum pulsed laser energy density range, the resultant junction depth and electrical characteristics, and the presence of laser-and implantation-induced residual defects. Vacuum Deaeration for Ocean Thermal-Energy-Conversion Open-Cycle Applications.
A. Golshani, and F. C. Chen. 1981, 21p
Contract W-7405-ENG-26
International Association of Science and Technology for Development energy symposium, San Francisco, CA, USA, 20 May 1981.

Seawater deaeration is a process affecting almost all proposed Ocean Thermal Energy Conversion (OTEC) open-cycle power systems. If the noncondensable dissolved air is not removed from a power system, it will accumulate in the condenser, reduce the effectiveness of condensation, and result in deterioration of system performance. A gas desorption study was initiated at Oak Ridge National Laboratory (ORNL) with the goal of mitigating these effects; this study is designed to investigate the vacuum deaeration process for low-temperature OTEC conditions where conventional steam stripping deaeration may not be applicable. Studies were carried out on two areas: (1) vacuum deaeration in a packed column; and (2) deaeration in the barometric leg of the intake system. The design of a gas desorption test loop and a barometric intake system are described, the results of vacuum deaeration in a packed column and a barometric intake system are presented, and the saving that can be achieved when the packed column is combined with the barometric system is discussed. Vacuum deaeration laboratory experiments of three different kinds of packing in a packed column test section and a series of barometric intake deaeration experiments have been performed. A conceptual OTEC deaeration subsystem design based on these results and its implications upon an OTEC open cycle power system are presented. (ERA citation 06:023344)

Test Results of Heat-Exchanger Cleaning in Support of Ocean Thermal Energy Conversion.
D. F. Lott. Dec 80, 283p NCSC-TM-298-80
Contract AI02-79CH00135

These tests evaluated flow-driven brushes, recirculating sponge rubber balls, chlorination, and mechanical system/chlorination combinations for in-situ cleaning of two potential heat exchanger materials: titanium and aluminum alloy 5052. Tests were successful when fouling resistance was $<3.0 \times 10$ exp -4 ft exp 2 hr- exp 0 F/Btu. Results indicated systems and cleaning techniques using brushes, soft sponge balls, and various concentrations of chlorine had some potential for maintaining heat transfer efficiency. SPS Susceptible-System Cost Factors Investment Summary and Mitigation-Cost-Increment Estimates.
E. L. Morrison. May 80, 13p
Contract AI01-80ER10160

The Electromagnetic Compatibility (EMC) evaluation program supporting the SPS Concept Development Evaluation Phase has included examinations of the degradation in capability of all susceptible communications and electronic systems that could be exposed to SPS emissions, the development and testing of mitigation techniques to allow operation in the SPS environment, and the development of total investment and mitigation cost data. Mitigation costs relate only to the modification or reconfiguration of susceptible systems; redeployment being a possible consideration for rectenna siting exercises during the SPS Engineering Development Phase. An extensive survey is summarized regarding the current and planned facilities using the equipment categories listed: microwave communications; radar systems; sensors; computers; medical equipment; and research support. Current investment, future plans, and mitigation costs are presented, with geographic distribution in six CONUS areas. (ERA citation 06:021751)

High-Temperature Turbine Technology Program. Turbine Subsystem Design Report: Low-Btu Gas.
M. W. Horner. Dec 80, 227p
Contract AC01-76ET10340

The objective of the US Department of Energy High-Temperature Turbine Technology (DOE-HTTT) program is to bring to technology readiness a high-temperature (2600 exp 0 F to 3000 exp 0 F firing temperature) turbine within a 6- to 10-year duration, Phase II has addressed the performance of component design and technology testing in critical areas to confirm the design concepts identified in the earlier Phase I program. Based on the testing and support studies completed under Phase II, this report describes the updated turbine subsystem design for a coal-derived gas fuel (low-Btu gas) operation at 2600 exp 0 F turbine firing temperature. A commercial IGCC plant configuration would contain four gas turbines. These gas turbines utilize an existing axial flow compressor from the GE product line MS6001 machine. A complete description of the Primary Reference Design-Overall Plant Design Description has been developed and has been documented. Trends in overall plant performance improvement at higher pressure ratio and higher firing temperature are shown. It should be noted that the effect of pressure ratio on efficiency is significally enhanced at higher firing temperatures. It is shown that any improvement in overall plant thermal efficiency reflects about the same level of gain in Cost of Electricity (COE). The IGCC concepts are shown to be competitive in both performance and cost at current and near-term gas turbine firing temperatures of 1985 exp 0 F to 2100 exp 0 F. The savings that can be accumulated over a thirty-year plant life for a water-cooled gas turbine in an IGCC plant as compared to a state-of-the-art coal-fired steam plant are estimated. A total of $500 million over the life of a 1000 MW plant is projected. Also, this IGCC power plant has significant environmental advantages over equivalent coal-fired steam power plants. Advanced Thermionic Energy Conversion. Joint Highlights and Status Report, July-September 1979.
1979, 131p COO-2263-16
Contract AC02-76ET11293

The DOE portion of the effort is directed primarily toward terrestrial applications of thermionic energy converters suitable for use with fossil fueled heat sources in power plants. The NASA program is directed at establishing the technical feasibility of an advanced, light-weight, long-life thermionic conversion system compatible with a remote nuclear or solar heat source. The principal application foreseen at this time is in nuclear electric propulsion (NEP) missions in the mid-1990's. Significant accomplishments for the DOE program include: (1) successfully operating a thermionic converter using a cold insulator seal (Plexiglass and Viton); (2) completed fabrication and testing of SPC-9, a reference planar converter with smooth molybdenum electrodes; (3) created a shooting type analytical ignited mode converter computer model; (4) projected the operating conditions needed to achieve advanced converter performance with a thick cesium oxide collector; and (5) invented a cellular ceramic heat exchanger for obtaining high radiant heat flux from a hot gas. Accomplishments for the NASA program include: (1) achieved over 3100 hours of operation with the cylindrical converter JPL-5 (STR/STR); (2) provided guidelines for definition of optimum lead characteristics in the JPL NEP computer program; and (3) performed a preliminary NEP optimization study which suggests a 400 kWe system with a specific mass of 26 kg/kWe is possible with present converter performance (V/sub B/ = 2.0). Details are presented. (ERA citation 06:022154)

Research and Development of the Osmo-Hydro Power Heat Engine. Final Report.
25 Nov 80, 211p
Contract AC05-78ET15346

The Osmo-Hydro Power (OHP) or Pressure-Retarded Osmosis (PRO) heat engine is a possible means for producing economical electric power from low-temperature heat sources. The engine utilizes semipermeable membranes to cause the permeation of a solvent from a dilute low-pressure solution to a concentrated high-pressure solution. The potential energy thus acquired is converted to useful energy by means of a turbogenerator. The process can be considered as one in which the free energy of mixing is converted to useful power. By appropriate application of a heat source and a heat sink, the original dilute and concentrated solutions are recovered, thus completing the heat engine cycle. The results of this initial project to study osmotic power generation from waste heat indicate what research paths must be followed to continue the development of distillation and conju-

gation as unmixing methods. In addition, precipitation and stratification have been shown to be desirable because of the possibility of readily matching a binary system with either a membrane presently available or one readily modified from an existing membrane. The OHP heat engine in its ultimate development would have the following general characteristics: it would be able to utilize low-grade heat sources, such as unconcentrated solar energy or waste heat below 100 exp 0 C., heat sources as low as 50 exp 0 C can be used; the engine should be able to produce electricity for 0.12 $/kWh, or less, but the thermal efficiency will be less than 25% of Carnot efficiency at the same temperature limits; and the engine would be modular; i.e., it could be scaled up or down largely by adding or subtracting discrete permeator and heat exchanger units. Loss of Line Shutdown for Line-Commutated Utility-Interactive Inverter.
E. E. Landsman. Mar 81, 10p
Contract AC02-76ET20279

The line-commutated, single-phase, utility-interactive inverter has been used in utility-connected photovoltaic (PV) and wind energy systems because it is commercially available at an attractive price. If unity power factor operation is required, a shunt capacitor can be used. This causes a problem if the utility line is disconnected; the inverter can continue to run and can thus be a hazard. This can be solved by using a fast-acting overvoltage detection circuit which operates directly on the inverter control electronics. (ERA citation 06:021815)

Residential Photovoltaic Systems Costs.
C. H. Cox, III. 1980, 8p CONF-800806-17
Contract AC02-76ET20279
15. intersociety energy conversion engineering conference, Seattle, WA, USA, 18 Aug 1980.

A study of costs associated with the installation and operation of a residential photovoltaic system has been conducted to determine present and projected (1986) status. As a basis for the study, a residential photovoltaic system design projected for 1986 was assumed, consisting of two principal components: a roof-mounted array and a utility-interactive inverter. The scope of the study encompassed both silicon and cadmium sulfide photovoltaic modules. Cost estimates were obtained by a survey and study of reports generated by companies and agencies presently active in each of the subsystem area. Where necessary, supplemental estimates were established as part of this study. The range of estimates for silicon-based systems strongly suggest that such systems will be competitive for new installations and reasonably competitive for retrofit applications. The cadmium-sulfide-based system cost estimates, which are less certain than those for silicon, indicate that these systems will be marginally competitive with silicon-based systems for new construction, but not competitive for retrofit applications. Significant variations from the DOE system price sub-goals were found, however, particularly in the areas of array mounting, wiring and cleaning. Additional development work appears needed in these areas. (ERA citation 05:027122)

Contract NAS-7-100-954527

Formulation of the butyl acrylate syrup/casting pottant was completed and is now ready for the first stage of industrial evaluation. The formulation contains an ultraviolet stabilizer system and may be cured with an initiator that, unlike former selections, presents no shipping or handling hazards to the user. The catalyzed syrup is stable at room temperature and has a pot life of at least eight hours. The syrup cures to a transparent rubber in 18 minutes at a temperature of 60 exp 0 C. The formulation of the ethylene/methyl acrylate lamination pottant was also completed. This compound is the alternative pottant to ethylene/vinyl acetate (EVA) and is similarly produced as an extruded sheet that is wound into rolls. Experiments were conducted to select the most appropriate base resin for this compound and generate a first-cut formulation suitable for industrial evaluation purposes. The large scale extrusion conditions were determined and a 250 pound quantity was produced as a film of 30 inch width and 0.02 inch gauge. This resin is inherently non-blocking; consequently no release paper was used to separate the plies. Experimental modules were prepared to verify performance and the cure profile was determined at a variety of times and temperatures. Due to the current commercial interest in the EVA lamination pottant some revised studies were conducted with respect to the time/temperature cure requirements for successful use of this compound. The times needed to produce successful gel contents were redetermined at a variety of temperatures and these results were related to the peroxide half-life temperature curve. Contract NAS-7-100-954796

The attributes of the various metallization processes have been investigated which express themselves in economic results. It has been shown that several metallization process sequences will lead to adequate metallization for large area, high performance solar cells at a metallization add-on price in the range of $6.- to 12.-/m exp 2 , or 4 to 8 cents/W(peak), assuming 15% efficiency. Conduction layer formation by thick film silver or by tin or tin/lead solder leads to metallization add-on prices significantly above the $6.- to 12.-/m exp 2 range. The wet chemical processes of electroless and electrolytic plating for strike/barrier layer and conduction layer formation, respectively, seem to be most cost-effective. Vacuum deposition of the strike/barrier layer can be competitive with electroless plating. (ERA citation 06:021767)

Monitoring and Control Requirement Definition Study for Dispersed Storage and Generation (DSG). Volume V. Final Report, Appendix D: Cost-Benefit Considerations for Providing Dispersed Storage and Generation for Electric Utilities.
Oct 80, 40p
Contract AI01-79ET29372

A major aim of the US National Energy Policy, as well as that of the New York State Energy Research and Development Authority, is to conserve energy and to shift from oil to more abundant domestic fuels and renewable energy sources. Dispersed Storage and Generation (DSG) is the term that characterizes the present and future dis-

persed, relatively small (<30 MW) energy systems, such as solar thermal electric, photovoltaic, wind, fuel cell, storage battery, hydro, and cogeneration, which can help achieve these national energy goals and can be dispersed throughout the distribution portion of an electric utility system. Cost benefit considerations are extremely important in obtaining the acceptance of dispersed storage and generation by the electric utilities. These considerations may involve somewhat different economic analyses depending on whether the generation is utility, customer, or combined ownership. It will be necessary to get acceptance of more easily understood methods for evaluating the economics of DSG because much of the benefits of DSG may accrue in the generation and transmission portions of the utility system while the costs tend to be centered in the distribution portion of that system. Depending on the rating and availability of the DSG, the monitoring and control portion of the system may be relatively low in cost compared to the value of the energy supplied for DSGs in the 5 MW range and above and relatively high in cost compared to the smaller 10 to 50 kW units. The influence of other factors, such as reliability, capital costs, and other economic measures, can be important to utility and customer alike in judging the costs and benefits of DSGs. Development and Fabrication of a Solar-Cell-Junction Processing System. Quarterly Progress Report No. 5.
R. Kiesling. Apr 81, 34p
Contract NAS-7-100-955640

Fabrication of the first stage of the pulsed electron beam annealer was completed. The objective of these initial checks was to test the functioning of its separate subsystems. Appropriate modifications based upon measurements taken are planned for the next quarter. Annealing of four inch wafers at the required rate must await completion of the wafer transport development and fabrication. There were four groups of tests, those of the mechanical and electrical subsystems, pulse generator, electron beam diode and the annealing process. Annealing experiments were begun at the end of March and will continue after modification of the pulser to insure reproducibility and uniformity. Electrical characterization of diode behavior as a function of varying paramerers is far advanced. Initial tests of subsystems and the pulse generator are complete using the 160 kV test power supply and the first production run of dielectric liners. The complete engineering system design has been formulated, and the accompanying manufacturing detail drawings are about 60 percent complete. The entrance and exit Y tracks of the processing chamber have been designed to interconnect with the 50 carrier cassette elevator locks by means of short three-phase transition track sections located between the outside vacuum locks and the processing chamber. Disk MHD Generator Study.
F. D. Retallick. Oct 80, 422p NASA-CR-159872, AESD-TME-3064
Contract AI01-77ET10769

A parametric study of coal-fired MHD/steam power plants with disk-shaped MHD generators was performed, in order to investigate the potential of such systems. Both open-cycle and closed-cycle MHD power trains were investigated. For the open-cycle disk power plants, system configurations of three basic types were evaluated: one type with directly-fired high temperature regenerative air heaters; a second type with separate gasifier-fired high temperature regenerative air heaters; and a third type without a regenerative air heater but with oxygen enrichment of the MHD combustor oxidant. The closed-cycle disk power plant systems analyses investigated the performance of argon-driven disk generator systems with direct coal combustor firing of the argon regenerators. Open-cycle disk generator performance calculated in the study were found to lie in the range of performances reported by similar studies of linear MHD systems. The calculated performances of the closed-cycle disk generator systems were also found to be comparable to the calculated performances for similarly-sized linear generator systems. Costs for disk-related components were determined to be from one-half to three-quarters of the major component costs for linear MHD power systems. Closed-cycle disk component costs were also shown to have the potential for being significantly lower than those of comparable linear MHD systems. (ERA citation 06:020361)

Contract AI01-77ET10769
19. symposium on the engineering aspects of magnetohydrodynamics, Tullahoma, TN, USA, 15 Jun 1981.

Burner pressure oscillations and interelectrode voltage oscillations measured in an open-cycle supersonic flow Hall generator are presented. The ionized gas for the channel was supplied by seeding the approximately 1 lb/sec of hydrogen-oxygen combustion products with cesium. Since both the burner and the channel were located within magnetic fields exceeding 4 Tesla during operation, an infinite probe pressure measurement technique was used to measure burner pressure oscillations. Calibration of the burner pressure transducer using a resonance tube technique is presented. Evidence is presented for the existence of the first longitudinal mode of oscillations (5000 Hz) within the burner. Interelectrode voltage oscillations were simultaneously measured at two seperate axial stations. The magnitude change and the phase shift between the two signals was interpreted as a decaying magnetoacoustic wave driven by the burner that propagates at local gas plus sonic velocities. The amplitude of the electrical voltage oscillations at the start of the power producing region of the channel varied with the magnetic field. This variation is compared with the results of a simple perturbation analysis. Arguments are presented for using an unsteady model for analyzing wave processes in channels. (ERA citation 06:023689)

Performance Calculations for 200-1000 MWe MHD/Steam Power Plants.
P. J. Staiger. 1981, 11p NASA-TM-81775, CONF-810639-1
Contract AI01-77ET10769
19. symposium on the engineering aspects of magnetohydrodynamics, Tullahoma, TN, USA, 15 Jun 1981.

The effects of MHD generator length, level of oxygen enrichment, and oxygen production power on the performance of MHD/steam power plants ranging from 200 to 1000 MW in electrical output are investigated. The plants considered use oxygen enriched combustion air preheated to 1100 exp 0 F. Both plants in which the MHD generator is cooled with low temperature and pressure boiler feedwater and plants in which the generator is cooled with high temperature and pressure boiler feedwater are considered. It is shown that for plants using low temperature boiler feedwater for generator cooling the maximum thermodynamic efficiency is obtained with shorter generator and a lower level of oxygen enrichment compared to plants using high temperature boiler feedwater for generator cooling. It is also shown that the generator length at which the maximum plant efficiency occurs increases with power plant size for plants with a generator cooled by low temperature feedwater. Also shown is the relationship of the magnet stored energy requirement to the generator length and the power plant performance. Possible cost/performance tradeoffs between magnet cost and plant performance are indicated. (ERA citation 06:022151)

Assessment of Disk MHD Generator for a Base-Load Powerplant.
D. L. Chubb, F. D. Retallick, C. L. Lu, M. Stella, and J. D. Teare. 1981, 15p CONF-810639-2
Contract AI01-77ET10769
19. symposium on the engineering aspects of magnetohydrodynamics, Tullahoma, TN, USA, 15 Jun 1981.

A summary of the results from a recent Westinghouse-MIT systems study of the disk MHD generator are presented. Both open and closed-cycle disk systems were investigated in the Westinghouse-MIT study. Costing of the open-cycle disk components (nozzle, channel, diffuser, radiant boiler, magnet and power management) was done. However, no detailed costing was done for the closed-cycle systems. Preliminary plant design for the open-cycle systems was also completed. Based on the system study results, an economic assessment of the open-cycle systems is presented. The following open-cycle plant efficiencies, eta/sub t/, were calculated. For a directly fired preheat system with 1920 exp 0 K (2006 exp 0 F) preheat temperature eta/sub t/ = 45.5%, for a directly fired system with 1650 exp 0 K (2500 exp 0 F) preheat temperature eta/sub t/ = 43.4%, for a separately fired preheat system at 1920 exp 0 K (2006 exp 0 F) eta/sub t/ = 39% and for an oxygen-enriched system with low temperature recuperative preheat eta/sub t/ = 40.5%. Costs of the open-cycle disk components are less than comparable linear generator components. Also, costs of electricity for the open-cycle disk systems are competitive with comparable linear systems. Advantages of the disk design simplicity are considered. Improvements in the channel availability or a reduction in the channel lifetime requirement are possible as a result of the disk design. (ERA citation 06:023690)

Accuracy of the Edgeworth Approximation for LOLP Calculations in Small Power Systems.
D. J. Levy, and E. P. Kahn. Jan 81, 10p CONF-810703-1(Rev.)
Contract W-7405-ENG-48
IEEE Power Engineering Society summer meeting, Portland, OR, USA, 26 Jul 1981.

Because they speed numerical calculations and exhibit functional dependences, Edgeworth-type series are increasingly used to approximate and calculate LOLP's. They are usually sufficiently accurate for large power systems (> 15,000 MW), but can be very inaccurate for small systems or those with low forced outage rates. This is because the approximating Edgeworth-type series are appropriate only for continuous probability densities, while discrete lattice-type density functions describe a typical power system's probability properties. This paper investigates these inaccuracies for small systems (less than or equal to 5000 MW), working out specific examples in a numerical approach and examining in a numerical approach and examining underlying functional dependences in an analytic approach. Solar-Central-Receiver Hybrid Power System, Phase I. Midterm Topical Report (Draft).
Jun 79, 363p
Contract AC03-78ET21038

An analysis was performed to identify the market for solar hybrid power systems technology. Cost/benefit ratios were calculated for first generation hybrid technology in nine US geographic regions for the year 1990. Parametric analyses on hybrid subsystems were performed to develop cost, preliminary design and performance data for the preferred system selection process. Subsystems analyzed include the collector/receiver subsystem, salt piping and salt heat exchangers, the salt storage subsystem, the nonsolar subsystem, and the electric power generation subsystem. The process and criteria for selecting the preferred system and the specifications of that system are given. (ERA citation 06:023338)

Technological Activities for High Performance Receivers.
Final Report.
G. Schmidt, E. Kirner, and H. Zewen. Dec 80, 86p BMFT-FB-T-80-133, UR-39979-79
In German; English Summary.

For solar thermal power plants, the energy transfer efficiency from the incident solar radiation into the heat transfer medium has a direct impact on the overall plant efficiency and influences the size of the cost effective collector field. For this reason technological activities were accomplished for high performance receivers to be operated in closed Rankine cycles with organic heat transfer media at temperatures between 350 C to 400 C and gas turbine cycles at temperatures between 800 C to 900 C. Under simulated test conditions the thermal and mechanical resistance of the structure and the behavior of different heat transfer media with respect to thermal efficiency and stability were analyzed.

Laser Scanning Measurements on Solar Cell Test Pattern NBS-22.
Final rept. 1 Jun 80-30 Nov 81,
W. F. Lankford, P. Kowalski, and H. A. Schafft. May 81, 53p NBSIR-81-2260
Sponsored in part by Solar Energy Research Inst., Golden, CO.

The NBS laser scanner has been used to make measurements on the solar cell test pattern, NBS-22, to verify the theoretical calculations of Sawyer, Lehovec, and Fedotowski. The photovoltaic response from cells with controlled sheet resistance step changes and breaks in the metallization contact to the cell was measured and compared to the theoretical predictions. Laser scanner limits of resolution were identified and proposed improvements were discussed. Preliminary measurements indicate that it is possible to measure the sheet resistance of the emitter layer of solar cells with an accuracy of several percent, using the laser scanner.

Water Use by Coal-Fired Power Plants in 1975,
Norman L. Dalsted, and John W. Green. Mar 81, 50p AGESS-810326

Steam electric generation plants require large quantities of water for dissipation of heat and waste disposal. Major systems in place are once-through, cooling tower, cooling ponds, and combination systems involving two or more of these systems. Cooling tower systems are becoming more prevalent as water withdrawal requirements are less and heat is released through evaporative techniques. But closed evaporative methods are large consumers of water. Assessment of water requirements of existing coal-fired steam power generation facilities provides essential input for analyses of the impact of new coal-fired facilities on water and other natural resources. The report summarizes water use of coal-fired power plants of over 100 megawatts in 1975.

Automatic-Control-Algorithm Effects on Energy Production.
G. M. McNerney. 1981, 9p CONF-810226-6
Contract AC04-76DP00789
DOE/NASA wind turbine dynamics workshop, Cleveland, OH, USA, 24 Feb 1981.

Algorithm control strategy for unattended wind turbine operation is a potentially important aspect of wind energy production that has thus far escaped treatment in the literature. Early experience in automatic operation of the Sandia 17-m VAWT has demonstrated the need for a systematic study of control algorithms. To this end, a computer model has been developed using actual wind time series and turbine performance data to simulate the power produced by the Sandia 17-m VAWT operating in automatic control. The model has been used to investigate the influence of starting algorithms on annual energy production. The results indicate that, depending on turbine and local wind characteristics, a bad choice of a control algorithm can significantly reduce overall energy production. The model can be used to select control algorithms and threshold parameters that maximize long-term energy production. An attempt has been made to generalize these results from local site and turbine characteristics to obtain general guidelines for control algorithm design. (ERA citation 06:023410)

Low-Cost, Actively-Cooled Linear Photovoltaic Receiver.
N. F. Shepard, Jr. 1981, 20p CONF-810526-14(Dr)
Contract AC04-76DP00789
15. IEEE PV specialists conference, Orlando, FL, USA, 11 May 1981.

The development of a novel receiver design for a linear focus concentrator is discussed. This design concept, which employs a pair of nested glass tubes, offers the potential for low-cost production through reduced material content and design simplicity. A specially configured inner borosilicate glass tube functions as the mounting surface for the solar cell circuit in this dual focus receiver geometry. This inner tube, which is capped at each end to provide an interior dead air space, is inserted within a 2 inch ID glass pipe which is part of the Corning Pyrex beaded pressure process piping system. The selected receiver coolant, which is designated as Synfluid (2 centistokes kinematic viscosity), is circulated through the outer glass pipe in direct contact with the solar cell circuit active area. The concentrated irradiance from the parabolic trough impinges on the outer glass pipe and is optically transmitted through the clear synthetic mineral oil to the solar cell circuit. A prototype receiver of this design has been installed in a parabolic trough and subjected to a series of characterization tests to evaluate both thermal and electrical performance. (ERA citation 06:021780)

Cadmium Sulfide-Copper Sulfide Heterojunction Cell Research. Quarterly Progress Report, March 1-June 1, 1979.
Aug 79, 66p
Contract AC02-77CH00178

Progress has been made on improving the photon efficiency of the planar CdS/Cu sub 2 -S solar cell. Currents in excess of 20 mA/cm exp 2 have been achieved. Mixed sulfide solar cells responsive to heat treatment are now being produced. The morphology of the Cu sub 2 S/CdZnS junction has been examined and found to be significantly different than the morphology on CdS/Cu sub 2 S cells. Efficiencies measured under ELH simulation approaching 8% have been achieved. Work in the analytical task has focused on establishing the experimental techniques to study the trap levels in the CdS and to provide a working model for the voltage instabilities in some (CdZn)S/Cu sub 2 S cells. Cells under roof top exposure continue to be monitored. (ERA citation 06:021782)

Cadmium Sulfide-Copper Sulfide Heterojunction Cell Research. Quarterly Progress Report, September 1-December 1, 1978.
Jun 79, 54p
Contract AC02-77CH00178

The CdS/Cu sub 2 S cell development effort was directed toward the planar junction cell. This junction gives a higher open circuit voltage than that achieved with the highly textured cell structure. Optical measurements have shown that applying a two-layer anti-reflection coating to the planar cell does not achieve the high photon economy shown by the textured structure. Total reflectance measurements have revealed that this is due to the lack of light trapping in the planar structure. Modified cell designs are now being developed with the planar junction necessary for high open circuit voltage while achieving the necessary light trapping. Work on the (CdZn)S/Cu sub 2 S cell has revealed that cell performance is extremely sensitive to the method of Cu sub 2 S producton. Appropriate structural studies have been initiated to identify the underlying reasons. Theoretical analysis and modeling of the current flow in the Cu sub 2 S layer has shown that the conventional one-dimensional analysis can lead to significant errors in interpreting the effects of sheet resistance. A rigorous two-dimensional current analysis is being conducted. The importance of the changes in absorption coefficient of the Cu sub 2 S stoichiometry has been identified and the relation between stoichiometry, resistivity, and absorption coefficient derived. On the basis of a review of the encapsulation task in the large scale silicon array program it has been determined that inorganic glasses are probably the only viable encapsulant for a CdS/Cu sub 2 S cell. Cadmium Sulfide-Copper Sulfide Heterojunction Cell Research. Annual Report, September 1, 1979-August 31, 1980.
Dec 80, 107p
Contract AC02-77CH00178

The primary goal of this program, increasing the conversion efficiency of a thin-film cell based on CdS/Cu sub 2 S, has been achieved. A number of (CdZn)S/Cu sub 2 S cells have been made with conversion efficiencies in excess of 10% when tested in collimated sunlight. The highest efficiency achieved was 10.2% for a cell with 16% Zinc which had the following parameters; V/sub oc/ = 0.60V, J/sub sc/ = 22.8 mA/cm exp 2 (pro-rated to 100 mW/cm exp 2) FF = 74.9%. Further improvement in the performance of CdS/Cu sub 2 S cells beyond the previously reported 9.2%, was found to be limited by deficiencies in the fundamental knowledge and control of the Cu sub 2 S layer. A number of process changes in the production of CdS/Cu sub 2 S cells have been explored and are reported on. Transient capacitance measurements on CdS/Cu sub 2 S cells and further development of an integral encapsulation are also reported. (ERA citation 06:021785)

Investigation of Solar Cells Based on Cu sub 2 O. Progress Report, June 1, 1980-November 30, 1980.
L. C. Olsen. Feb 81, 34p
Contract AC02-77CH00178

Progress was made in three areas: microstructure of Cu sub 2 O substrates; correlation of Cu sub 2 O microstructure with Cu/Cu sub 2 O cell properties; and in fabrication of Tl/Cu sub 2 O Schottky barriers. Characterization of Cu sub 2 O substrates with IMMA indicates that Cl is uniformly distributed through grains, Mg precipitates at grain boundaries and Na and Fe precipitates occur throughout the material. It is clear that the presence of Cl results in lower p-type resistivities. Previous photoresponse scans established that grain boundaries are not significantly active concerning minority carrier recombination. I-V analyses of Cu/Cu sub 2 O cells indicate that leakage current components are a result of distributed effects, and not a grain boundary mechanism. It is not yet clear whether the distributed effects are strictly a surface effect, or a result of bulk defects such as Na and Fe precipitates. Tl/Cu sub 2 O Schottky barrier studies are progressing well. This device structure is being used as a means of determining if a significant built-in voltage can be achieved with a Cu sub 2 O cell. Problems were encountered concerning deposition of thin Tl films. The films tend to agglomerate. Substrates will be cooled to counter the apparent lateral diffusion. V/sub oc/ values greater than 0.6 volts were obtained with thick film Tl/Cu sub 2 O cells, however. These results suggest an improved built-in potential was achieved. (ERA citation 06:021786)

Contract AC02-77CH00178

Results described in this report clearly indicate that high quality small area diodes can be fabricated with negligible edge effects. It is shown that these devices can be used to determine carrier transport mechanisms, which, in turn, are related to the nature of defects present in the substrate. The sectioning technique, in conjunction with other techniques described previously, enables a detailed analysis of the nature of defects (and their propagation paths). A unified approach towards applications of a two-wavelength laser scanner for photovoltaic material/device characterization is discussed in the appendix. (ERA citation 06:021788)

Cadmium Sulfide-Copper Sulfide Heterojunction Cell Research. Final Report, September 1, 1978-August 31, 1979.
Dec 79, 127p
Contract AC02-77CH00178

Research on the planar CdS/Cu sub 2 S cell to increase the short circuit currents to the levels achieved with the 9.15% textured cell is given. It was established early in the contract that light trapping is essential for high currents and a front surface texturing process has been developed to achieve this. As a result, short circuit currents have been raised to over 21.0 mA/cm exp 2 . The highest efficiency achieved with the planar junction cell during the contract was 7.81%. Cells heat treated to their highest short circuit currents have shown fill factors below the design requirement of about 74% thus putting a limit on achievable efficiency. Progress has been made on improving the performance of the (CdZn)S/Cu sub 2 S again with the major emphasis being on improved short circuit currents. Modifying the CdZn/S deposition procedure has resulted in considerably improved short circuit currents to over 21 mA/Cm exp 2 , and a cell efficiency of 8.19% has been recorded. Fundamental studies have focused on the influence of substrate composition and heat treatment on junction field and collection efficiency. Quantitative analysis has been carried out of the optimal material parameters required to maximize energy converson efficiency. It has been shown a relatively narrow range of properties in the CdS and Cu sub 2 S is necessary to achieve the highest efficiencies. The encapsulation task has focused on trial depositions of glass applied by electron beam evaporation. (ERA citation 06:021794)

Westinghouse Electric Corp., Pittsburgh, PA.
Research, Development, and Demonstration of Nickel-Iron Batteries for Electric Vehicle Propulsion. Annual Report for 1980.
Mar 81, 114p
Contract W-31-109-ENG-38

The FY 1980 program continued to involve full-size, prototype cell, module and battery fabrication and evaluation, aimed at advancing the technical capabilities of the nickel-iron battery, while simultaneously reducing its potential cost in materials and process areas. Improved Electroprecipitation Process (EPP) nickel electrodes of design thickness (2.5 mm) are now being prepared that display stable capacities of 23 to 25 Ah for the C/3 drain rate at 200+ test cycles. Iron electrodes of the composite-type are delivering 24 Ah at the target thickness (1.0 mm). Iron electrodes are displaying capacity stability for > 1000 test cycles in continuing 3 plate cell tests. Finished cells have delivered 57 to 61 Wh/kg at C/3, and have demonstrated cyclic stability to 500+ cycles at 80% depth of discharge profiles at Westinghouse. A 6-cell module that demonstrated 239 Ah, 1735 Wh, 48 Wh/kg at the C/3 drain rate has also been evaluated at the National Battery Test Laboratory, ANL. It operated for 327 test cycles, to a level of 161 Ah at the C/3 rate, before being removed from test. Reduction in nickel electrode swelling (and concurrent stack starvation), to improve cycling, continues to be an area of major effort to reach the final battery cycle

life objectives. Pasted nickel electrodes continue to show promise for meeting the life objectives while, simultaneously, providing a low manufacturing cost. Refinements have occurred in the areas of cell hardware, module manifolding and cell interconnections. These improvements have been incorporated into the construction and testing of the cells and modules for this program. Temperature tests at 0 exp 0 C were performed on a 6-cell module and showed a decrease in capacity of only 25% in Ah and .29% in Wh as compared to 25 exp 0 C performance. Additional tests are planned to demonstrate performance at -15 exp 0 C and 40 exp 0 C. (ERA citation 06:023609)

International conference on fast ionic transport in solids, Gatlinburg, TN, USA, 18 May 1981.

Sodium-beta and beta alumina solid electrolytes may, under certain conditions, degrade when used in sodium/sulfur cells. Degradation of sodium-beta aluminas can take two forms: Mode I and Mode II. Mode I is the well-documented electro-mechanical propagation of a preexisting microcrack in the surface of the electrolyte. The critical electrode current densities, j/sub crit/, were determined below 100 exp 0 C using acoustic emission detection during electrolysis. The temperature dependence and magnitudes of j indicate that the applied voltage is an important factor. Mode II, a degradation involving internal sodium formation is briefly reviewed. Contract W-7405-ENG-48

The Exploratory Battery R and D area provides for the study of new electrochemical couples, or of new approaches to known battery systems. High temperature systems under investigation include Ca/molten salt/FeS sub 2 , Li/Lil-Al sub 2 O sub 3 /TiS sub 2 , and Na/ beta "-Al sub 2 O sub 3 /SCl sub 4 -NaCl-AlCl sub 3 . Ambient temperature systems being studied are Li/So sub 2 /C and Zn/NaOH/Fe(CN) sub 6 . New electrode/electrolyte formulations for Zn/KOH/NiOOH and Li/organic electrolyte/TiS sub 2 cells are being investigated, and a status study of ambient temperature secondary lithium batteries was conducted. Projects grouped in the Engineering-Science Research area include morphological and optical studies of battery electrodes in Pb/H sub 2 SO sub 4 /PbO sub 2 , Zn/KOH/NiOOH, and metal/air cells; and a thermal management study of the high-temperature Li/molten salt/FeS Battery. Improvements in alkaline (Zn/NiOOH and Fe/NiOOH) battery performance are being sought. Materials Research seeks to identify, characterize, and improve the materials and components to be used in batteries and electrochemical processes. Basic investigations have led to the discovery of a novel all-solid electrode structure for possible use as negative electrodes in molten-salt cells. New ternary lithium-transition metal oxides have been identified as possible electrode reactants for use in similar systems. Projects aimed at developing improved separators for high-temperature Na/S and Li/S cells are focusing on such materials as beta "-alumina, NASICON, conducting glasses, and novel superionic conductors. New polymeric separators are being studied for use in ambient-temperature Li/TiS sub 2 cells, and composition profiles in molten-salt electrolytes are being analyzed. Brief summaries of the separate research projects are presented. (ERA citation 06:022092)

Contracts DEN3-138, DE-A101-77ET-26945

The post-test evaluation of a single heat exchanger sodium hydroxide thermal energy storage module for use in solar electric generation is reported. Chemical analyses of the storage medium used in the experimental model are presented. The experimental verification of the module performance using an alternate heat transfer fluid, Caloria HT-43, is described. Based on these results, a design analysis of a dual heat exchanger concept within the storage module is presented. A computer model and a reference design for the dual system (storage working fluid/power cycle working fluid) were completed. The dual system is estimated to have a capital cost of approximately one half that of the single heat exchanger concept.

Studies of the Effects of Sub-Zero Storage Temperatures on the Properties of Pre-Mixed Polysulphide Sealants,
John W. Barber, Peter J. Hanhela, Robert H. E. Huang, and D. Brenton Paul. Oct 80, 30p Rept no. MRL-R-656

Pre-mixed polysulphide sealants were stored at -20, -30 and -40 C for selected intervals and then tested for conformity for the requirements of the appropriate MIL-specification in regard to cure rate or hardness, application time, tack-free time and peel strength. For Pro-Seal 899 and PR-1750 sealants, no significant change in hardness or peel strength occurred after prolonged storage at temperatures of -20 C and below; a minor decline in peel strength occurred with PR-1422. Application properties were also maintained for extended periods and at -40 C tests terminated only due to consumption of samples after storage times ranging from 7 to 16 weeks. These storage lives far exceed manufacturers' limits. Batch variations and stricter observation of class requirements could influence recommended storage times but at -40 C even materials such as PR-1750, which have a close tolerance in application life rating, may be pre-mixed and be safely stored for at least 10 weeks. Both class A and B sealants may be stored in pre-mixed form provided their application lives are at least 2 hours. Thawing is most conveniently and efficiently achieved by allowing the frozen sealant to equilibrate at room temperature. (Author)

Ultrahigh molecular weight m-carborane-siloxane polymers exhibit good stability at high temperature in vacuum. This thermal stability coupled with desirable viscoelastic properties make these materials attractive as thermoplastic adhesives for solar cell attachment to solar panel substrates, especially for hardened systems. Unfortunately, development of a reproducible chemical synthesis for these polymers has eluded all efforts in recent years. In this current effort to reproducibly prepare these ultrahigh molecular weight elastomers, major progress has been made. This progress has resulted from careful and orderly experimentation involving the main elements of the problem, namely: (a) purification of reactants and solvents,

(b) preparation, workup, and characterization of monomers, (c) preparation and workup of prepolymers, (d) development of a trace level, silanol end group analysis for estimating prepolymer advanceability, and (e) prepolymer advancement to the final polymer. Significant additional progress in the prepolymer preparation and advancement steps is still required for definition of a reproducible process for preparing the ultrahigh molecular weight material. Pending achievement of such progress, adhesive formulation efforts are limited. (Author)

Contract AC04-78CS15362

Synthetic modifications of silicones and fluoroelastomers, involving bulky substituents, occasional rigid linkages, interpenetrating networks of other polymers, and use of unconventional crosslinking methods, have been explored in order to decrease siloxane bond interchange and fluorocarbon chain crystallization, thought to be the cause of excessive compression set and emission of condensable volatiles. Siloxane diamines and diphenols have been synthesized for use as fluoroelastomer crosslinkers and chain separators. A number of commercially available elastomers were acquired and tested for tensile strength, modulus, elongation, hot and cold compression sets, volatiles, and hardness change, according to the proper ASTM methods. Only three of the materials failed any test, and that was low temperature compression set. (ERA citation 06:023372)

PATENT-4 230 959

Tracer studies involving CVD single crystals oxidized in oxygen 16 and oxygen 18 were unsuccessful in indicating the direction of diffusing species during oxidation of SiC. A refinement of this technique is planned. Research is also continuing on the characterization of the spherulitic growth which appears during oxidation. The influence on densification of pore curvature, dihedral angle, applied stress and internal pore pressure was undertaken from a theoretical point of view. The results using a simple model indicate that at low dihedral angle (less than 60 degrees) there is an equilibrium porosity in a polycrystalline material; for such a material there is no barrier to nucleation of cavities in dense material. At intermediate dihedral angles, pores with few sides would shrink and disappear, whereas those with many sides would initially shrink but would reach an equilibrium size at which densification would stop. In this case grain growth of the large pores would reduce the number of sides for the pore and promote further densification. For such materials there would be a small barrier to nucleation. Although the study of ceramics using transmission electron microscopy (TE) lagged behind metallurgy because of specimen preparation difficulties and because many ceramics are ionization sensitive to 100 kV electron beams, today there is considerable research activity. This is due to perfection of ion thinning methods (first devised by Castaing in the early 1950s actually for metals) and improvements in instrumentation, particularly high voltage, high resolution and analytical microscopes. These developments and many applications have been summarized recently and will not be given in any more detail in this review. However, it is important not to underestimate the severe problems of specimen preparation methods for ceramic materials. (ERA citation 06:023932)

Depth Resolved Measurements of Hydrogen Isotope Exchange in Carbon.
W. R. , Magee, C. W. Wampler. 1981, 11p
SAND-81-0302C
Contract AC04-76DP00789
Microfiche only after original copies are exhausted.

High resolution measurements of the depth profiles of hydrogen and deuterium implanted in carbon were made using SIMS. Nuclear reaction analysis was used to calibrate the concentration scales for the deuterium. The depth profiles of low fluence H and D implants show the D extends to slightly greater depths than the H at 1.5 keV. The retention of deuterium at high fluences was in good agreement with predictions of a saturation model. Depth profiles were also measured on samples implanted with 10 exp 18 D/cm exp 2 at 1.5 keV followed by hydrogen implants of 2 x 10 exp 17 H/cm exp 2 at the same energy. C comparison between these measured profiles and profiles calculated using the local mixing model shows that the model predicts the depth dependence of the H, D exchange reasonably accurately. Microstructure Examination and Peak Crystallization Activation Energy of MS-11A Molybdenum Sealing Glass-Ceramic.
R. K. Spears, and L. L. Johnson. 7 May 81, 32p
Contract AC04-76DP00656

Differential thermal analysis was used to determine the crystallization characteristics of a molybdenum sealing glass-ceramic designated as MS-11A. This glass--ceramic's crystalline phase is zinc orthosilicate. By varying the heating rates from 2 exp 0 C/min to 40 exp 0 C/min, the initiation of crystallization, the peak crystallization temperature and the activation energy of crystallization were determined. Both annealed and unannealed glass-ceramic samples were evaluated; however, there was no significant difference between the results of these two parameters. The activation energy of crystallization was calculated at approximately 40 kcal/mole. The minimum temperature of crystallization was 790 exp 0 C at a rate of 2 exp 0 C/min and 930 exp 0 C for a rate of 40 exp 0 C/min. The microstructure of all DTA samples was examined. A typical structure consisted of submicron grains of crystalline Zn sub 2 SiO sub 4 in a glass matrix. (ERA citation 06:020511)

Grant G0155191

This report presents results of innovative research on a novel rapid solidification technology method to produce fine ceramic powders of many compositions with unique properties. The process uses salt solutions and includes two steps, the first to evaporate the liquid and the second to very rapidly decompose the salt to a very fine powder. The process has been demonstrated in terms of the following material applications: aluminates, ferrites, phosphors, ionic conductors, and cements. This new technique of producing ceramic powders offers a number of potential advantages over existing methods such as ability to produce complex compositions, lower energy requirements, and improved properties.

Crystallization in Mixed Alkali Silicate and Borosilicate Glasses in Contact with Molten Sodium.
L. C. Klein, and C. J. Brinker. 1981, 20p CONF-810528-5
Contract AC04-76DP00789
83. symposium on nucleation and crystallization in glasses, Washington, DC, USA, 3 May 1981, Portions of this document are illegible.

Six mixed alkali silicate and borosilicate glasses were heat treated in contact with molten sodium at temperatures between 300 and 450 exp 0 C. In all cases a sodium metasilicate layer grew from the contact surface into the sample. For glasses with a molar ratio of Li sub 2 O to Na sub 2 O equal to about one, the interface between the crystal layer and the glass was flat, and the thickness of the layer increased proportional to the square root of time. When the molar ratio was increased to about two, the metasilicate layer grew with a cellular morphology and the thickness of the layer increased linearly with time. (ERA citation 06:023950)

Contract AC02-76CH00016
Plastics in material and structural engineering conference, Prague, Czechoslovakia, 23 Jun 1981.

When plastics are combined with mixtures of inorganic materials, high-strength, durable, fast-setting composites are produced. These materials are used in structural engineering and other applications, and as a result of the successes obtained to date, considerable research and development work is in progress throughout the world. One family of polymer-based composites receiving considerable attention is the concrete-polymer materials. Work in this area is directed toward developing new high-strength durable materials by combining cement and concrete technology with that of polymer chemistry. In addition to the significant property enhancement, many combinations of siliceous materials with polymers require lower energy inputs per unit of performance than either component alone. Development of Improved Corrosion- and Erosion-Resistance Coatings for Gas-Turbine Airfoils.
S. Shen. 1980, 58p
Contract AC03-78ET12292

The main objective of this program is to obtain a ceramic coating with sufficient density to prevent hot-corrosion element diffusion while accommodating the thermal induced stresses and strain encountered in the gas turbine airfoil application. A secondary objective is to include ceramic coatings for outer air seals and combustor components such as falseheads, crossover tubes, and igniters. In addition, these coatings may directly, or with minor modification, be of major interest for insulating diesel engine combustion zones. The application objective is to significantly enhance diesel and gas turbine engine durability when operating with minimally processed alternative fuels. Both steel tabs and IN-738 pins were used as substrate to be coated with Yttria-stabilized Zirconia using EB-PVD technique. Various bond layers including CoCrAlY, NiCrAlY and NiCoCrAlY were also deposited by PVD in a 100 kW coater followed by glass bead peening and vacuum heat-treatment at 1975 exp 0 F for four (4) hours. ZrO sub 2 (Y sub 2 O sub 3) top layers were deposited in a 200 kW coater with a pressure barrier system to enable oxygen gas being introduced during the coating process. Results are presented and discussed. (ERA citation 06:021999)

Stress Generation in Thermally Grown Oxide Films.
Final Report.
A. J. Kumnick, and L. J. Ebert. 7 Jul 81, 77p
NASA-CR-164520
Contract NAG3-49

A three dimensional finite element analysis was conducted, using the ANSYS computer program, of the stress state in a thin oxide film thermally formed on a rectangular piece of NiCrAl alloy. The analytical results indicate a very high compressive stress in the lateral directions of the film (approximately 6200 MPa), and tensile stresses in the metal substrate that ranged from essentially zero to about 55 MPa. It was found further that the intensity of the analytically determined average stresses could be approximated reasonably well by the modification of an equation developed previously by Oxx for stresses induced into bodies by thermal gradients.

Contract F33615-78-C-2052

The analysis of plate like structures such as blades built-up with composite laminate fibers requires the modification of an existing finite element computer program to include the coupling of in-plane stretching with out-of-plane bending of a plate. An industry standard computer program SAP IV was selected as host program to accept new composite plate finite element. The SAP IV Finite Element Computer Program was designed to accept new elements into its element library easily. The new element, in general, must be self contained since the general philosophy and program structure is 'overlayed' into the computer. The laminate composite plate element is the new element to be integrated into the element library. The new element named TYPE 9 is similar to element TYPE 6 in element description and input. The main difference is that element TYPE 9 has the ability to couple in-plane extension with out-of-plane bending which is possible with laminate plate behavior and theory. Element TYPE 9 is a quadrilateral element and is formulated from quadrilateral shape functions rather than by four triangles as in TYPE 6. Also, in general, TYPE 9 allows for material directions to be arbitrary for ease of material input descriptions. The element is modelled after the structure of element TYPE 6; therefore, element TYPE 9 can degenerate to element TYPE 6. (Author)

Stabilization of Acrylic Fibers and Microstructure of Carbon-Carbon Composites.
Final rept.,
D. R. Uhlmann. 7 Jun 81, 33p AFOSR-TR-81-0526
Grant AFOSR-77-3466

The work on the stabilization of acrylic fibers has demonstrated that various mantle-core structures are observed at intermediate stages of stabilization, that the dark mantles seen in optical thin sections can be related to the etched mantles seen on exposure to solvents for PAN, that the mantles

seen on fractured fiber ends reflect the underlying structure of the partly-stabilized fibers, that the development of these various mantless with time depends on the nature of the precursor fibers and the processing conditions, that liquid droplets can be produced during fracture of fibers during stabilization, and that the fracture of even a small number of fibers can produce effective cementation of a yarn during processing. The study of the interaction between mesophase material and carbon fibers has directed attention to the precipitation, growth and coalescence of mesophase material, which processes require ordering of small molecules in a viscous medium. On this basis, dynamic motion in the fluid rather than the presence of nucleating substrates is suggested to be the controlling factor in the structural development. Where dynamic motion is restricted, as in the interstices of a yarn, mesophase formation and growth are also restricted. Alignment of mesophase material with a substrate is primarily controlled through motion of the mesophase droplets in flow, which generally do not wet the substrate. Certain well-order surfaces are wetted by the mesophase material, but the effect is primarily noted on surfaces of comparable size to the droplets. (Author)

Fire Test Methodology for Aerospace Materials. 1: Thermal and Smoke Toxicological Assessments of Graphite/Bismaleimide and Graphite/Epoxy Systems.
Final Report,
M. D. Kanakia, W. G. Switzer, G. E. Hartzell, and H. L. Kaplan. Oct 80, 124p NASA-CR-166196, SWRI-03-5565-001
Contract NAS2-10140

Both materials possess a high degree of thermal stability, with total heat release values being essentially identical under piloted ignition conditions over a range of 5 to 10 W/sq cm incident heat flux. The graphite/epoxy material had a tendency to auto-ignite at a lower heat flux (about 7 W/sq cm) and produced about 23 percent higher peak heat release rates, approximately 42 percent more carbon monoxide and considerably more smoke than the graphite/bismaleimide under conditions of piloted ignition. Toxicological potencies of smoke produced from the two composites were equivalent for 30 minute exposures. Potencies were also comparable to many common materials, such as wood. There was no evidence for the formation of an 'unusual toxicant' nor for any short term post-exposure toxicological effects.

Graphite Fiber Surface Analysis by X-Ray Photoelectron Spectroscopy and Polar/Dispersive Free Energy Analysis.
L. T. Drzal, and G. E. Hammer. Apr 81, 24p
AFWAL-TR-80-4143
Contract F33615-77-C-5040

Graphite fibers of less than 10 microns in diameter are used as the reinforcing agents in structural epoxy matrix composite materials. Their efficiency in reinforcing is determined to a large degree by their degree of bonding to the epoxy. Commercial surface treatments maximize this adhesion without quantifying the interaction. The purpose of this work has been to relate the surface composition of commercial treated and untreated fibers to the 'real' fiber surface incorporated in composites. Hercules A and HM filters, treated and untreated, have been studied using X-ray photoelectron spectroscopy (XPS) and contact angle measurements before and after a 300 C vacuum heat treatment. XPS spectra indicated multiple chemical states of carbon and oxygen and a reduction in the high energy binding state of carbon on the treated A fiber after vacuum heat treatment. Elemental surface concentrations have been calculated using corrected XPS peak areas. Contact angles were measured on these same fibers using a micro-Wilhelmy technique which incorporated eight liquids having a wide range of polar to dispersive free energy ratios. Determination of the fiber surface free energies and the proportions due to polar and dispersive components was made. Good Correlation was found between the oxygen concentration as measured by XPS and the change in polar/dispersive ratios for the fibers with surface treatments. (Author)

Evaluation of Staple Polyester/Microfibrous Polyolefin Blended Batting as a Potential Thermal Insulating Material for clothing.
Technical rept.,
David A. Mikelson. Jun 80, 28p CE/MEL-213, NATICK-TR-81/007

The use of a new batting (composed of a blend of 43% polyester staple fibers and 57% polyolefin microfibers without binders) in lieu of the standard batting (composed of 100% staple polyester fiber with 10% resin binder) within the U.S. Army jacket and trouser liners was investigated. Initial laboratory characterization indicated that the new batting afforded thermal insulative protection equal to an equivalent weight of uncompressed standard polyester batting but half the thickness (bulk). However, this relationship did not translate into actual liner composite testing. The addition of cover fabrics and quilting changed the proportion and rate of radiative, convective, and conductive heat energy transfer thru these assemblies. Thus, at equivalent areal density (i.e., oz/yd sq.), the new material in unquilted panel form exhibited thermal resistance values ranging from 15 to 45% greater than that of the standard polyester batting in quilted panel form. Coincidently, the thickness of the unquilted new batting and quilted standard batting liner panels were equivalent. With laundering, the decrease in the thermal resistance values of the new batting composites coupled with a slight increase in that of the standard resulted in a basic equivalence of thermal insulative protection. Furthermore, surface area shrinkage ranged from 8 to 13% with the new batting composites versus 4% for the standard. It is concluded that this new batting is not a suitable substitute filling media within US Army field jacket and trouser lines. (Author)

The Effect of Twist and Twill Directions on Tensile Properties of Twill Fabrics.
Research note,
K. Kumaraswamy, and G. M. Venkatesh. Jul 76, 20p MP-84

It is generally known that the prominance of twill lines in a twill fabric is influenced by the direction of twist in the warp and weft yarns. Normally the left hand warp twill (also called 'S' twill) is more prominent with Z-twist in warp and weft and the right hand warp twill (also called 'Z' twill) is more prominent with S-twist in warp and weft. This interaction of twist and twill directions has some significant influence on certain physical properties of the fabric. This particular report gives some interesting results on the effect of the interaction between twist and twill directions on tensile properties of the twill fabrics. The results of this study show that the warpway tensile strength is higher for crossed twill constructions (prominent twills) with the exception of 2/2 twill weave, when the warp and weft yarns in the fabric are like twisted as compared to parallel twill constructions (non-prominent twill). The difference in warpway tensile strength has been attributed to the tightness of the structure in cross twill constructions and the bedding properties, being better for these constructions.

The Effect of Reed Quality and Constructional Variables of Fabric on Streakiness.
Research note.
Mar 74, 15p MP-61

With a view to select reeds for weaving different fabrics, the nature of dependence of fabric streakiness on uneven dent spacing of reeds has been studied exhaustively. Ratings of Moire patterns of a large number of reeds and the fabrics wovendyed and finished-from these reeds show that fabric streakiness increases linearly with unevenness in dent spacing of reeds. For medium and heavy fabrics, an increase in cloth cover factor accompanied by an increase in warp cover factor reduces fabric streaks. Lighter fabrics in which the warp cover factor is below 12 do not show such a trend. Changes in weft cover factor in the range studied-9 to 14-do not influence fabric streakiness. For any given quality of reeds and warp cover factor, the fabric streakiness is higher for the drawing order of 4 ends per dent than that for 2 and 3 ends per dent. Between 2 and 3 ends per dent, the difference in the appearance of streaks is small.

Washing of Textiles.
Circular rept.
Oct 72, 25p ENG-55

In the wet processing department of textile mills, the fabric undergoes various types of chemical treatments. After the treatment, the residual chemicals and other loose impurities in the fabric are to be removed which is done by washing. The fabric is washed either in rope form or in open width form. The washing machine usually incorporates two arrangements, squeeze arrangement to extract impure liquor from fabric and a wash water tank for dilution of fabric impurity. These two arrangements play important role in the washing mechanism. Details of the washing mechanism, their theoretical analysis and their practical application to various types of machines in order to understand the washing process, to improve washing performance and to reduce water consumption are presented in this report.

Use of Indian Cottons in Polyester-Cotton Blends.
Rept. no. 1.
c1973, 9p

The production of polyester fibers in India will increase manifold in the very near future. It is to be expected that the bulk of this will be consumed in blends with cotton and viscose. There will, therefore, be a considerable increase in the demand for cotton that is suitable for blending with polyester fibers. If only imported cottons are to be considered for these blends, the demand cannot be met. Suitable Indian cottons will, therefore, have to be used as substitutes for these cottons. In making the choice of suitable Indian cottons, test data on blend yarns using Indian cottons would be required. ATIRA has, therefore, decided to issue to its member mills a series of reports giving such data as well as information on the processing conditions used. The series will cover a number of yarns spun using different Indian cottons, in varying blend proportions with polyester fibers of different lengths and deniers. It should be pointed out that in these spinnings the Indian cottons will be carded using the processing parameters that would normally be used for carding cottons for superfine spinning. This procedure is being followed because earlier experiments in ATIRA have shown that 'super carding' is a good means of upgrading Indian cottons. It is, therefore, expected that super carding will enhance the suitability of Indian cottons for use in blends with polyester fibers. This is the first report of the series, and gives data on 40s and 60s yarns spun from Shankar-4 and ISC-67 cottons blended individually with polyester fibers of 38 mm and 1.2 denier. (Copyright (c) 1973.)

Use of Indian Cottons in Polyester-Cotton Blends.
Rept. no. 2,
c1973, 10p

The production of polyester fibers in India will increase manifold in the very near future. It is to be expected that the bulk of this will be consumed in blends with cotton and viscose. The series will cover a number of yarns spun using different Indian cottons, in varying blend proportions with polyester fibers of different lengths and deniers. This report, the second in the series, gives data on 32s, 40s and 50s yarns spun from Sankar-4, Digvijay and CO2 cottons blended individually with polyester fibers of 32mm and 2.2 denier. The most commonly used fiber length for polyester fibers in India at present is 38 mm, but this is generally blended with imported cottons with effective length 36 mm to 38 mm. As Indian cottons are of shorter length, a shorter staple polyester fiber was thought to be more compatible, and therefore 32 mm fibers have been used. The use of 32 mm fibers could also be expected to result in fewer crackers in bulk spinning with short cradles which are available in practically all the mills. (Copyright (c) 1973.)

Crack Growth Behavior of Alloy IN-100 under Sustained Load at 732 C (1350 F).
Final rept. Jul 77-Jun 80,
Robert C. Donath. Apr 81, 343p Rept no. AFWAL-TR-80-4131

Sustained load crack growth in IN-100 at 1350 F (732 C) is studied using two specimen geometries, a standard compact tension specimen and a radially cracked ring loaded in tension. The effects of specimen thickness on the growth rate are investigated covering a range from 0.22 inch (5.6mm) to 0.72 inch (18.3mm) in thickness. Only the thinnest specimens show a crack growth rate which is lower than that obtained from all of the other thickness specimens. Stress intensity factor, net section stress, load line displacement rate, and the C*-integral are investigated as possible crack growth rate correlating parameters. In addition, a crack driving force function, G, is developed for a linear elastic creeping solid which represents the excess of energy available for creating new crack surfaces. In particular, the crack growth rate is observed to decrease from an initially higher value to a 'steady state' rate which depends on the stress intensity factor, net section stress or load line displacement rate. In the correlation of the stress intensity factor, the magnitude of this initial growth rate is about double the 'steady state': creep crack growth rate. The concept of an effective crack length determined from specimen compliance measurements is introduced as a measure of crack length for severely tunneled crack front geometries. Neither net section stress, load line displacement rate nor C* are found to be acceptable as crack growth parameters based on data from both test geometries. Although the stress intensity factor, K, provides fair correlation, the phenomenology of creep crack growth prevents its description adequately with only a single parameter. (Author)

For many years it has been a goal of the materials scientist to quantitatively link the microstructures of steels to their gross mechanical properties. Because of the very complex structures of steels this goal has been very difficult to achieve. Yet it is believed that average, or otherwise characteristic, features of microstructure are related to overall mechanical properties in a well-defined and quantitative manner. Suitable models of structure together with the capabilities of computer programs which accurately model elastoplastic behavior offer new hope for predicting gross mechanical properties from a knowledge of microstructure. The approach taken in this paper is to represent the structure of a particular steel by a characteristic microcell. The deformation behavior of the microcell is then investigated with large-strain elastoplastic finite-element analysis and related to overall mechanical properties. Quantitative results for the elongation and microcells containing voids of different volume fractions and shapes have been determined. These include graphic descriptions of the growth of voids and the spread and eventual localization of plastic zones of deformation. Although some problems related to numerical stability of the solutions and detection of localized plastic flow remain, the preliminary results are encouraging. Specific recommendations for future work are made. (Author)

A dark-field transmission electron microscope technique was applied to a collection of submicron sized metal crystallites prepared by in-situ physical vapor deposition onto an amorphous carbon substrate in a vacuum of 2 x 10 to the -7th power torr in order to determine the melting behavior of individual crystallines. It was found that each particle melted suddenly at a single temperature which decreased with decreasing size. No liquid sheath was observed at any time. The melting temperature seemed to decrease nearly linearly with increasing surface curvature. Flat platelets with a near zero surface curvature but a significant surface to volume ratio showed no noticible size dependence of melting temperature. Oxidation of the particles raised their melting temperature as did embedding the particles in an amorphous carbon matrix. A simple thermodynamic model can account for all of the above observed effects. (Author)

Crystallization Kinetics of Two Metallic Glasses by Mossbauer Spectroscopy.
Master's thesis,
Denis Eugene Beller. 7 Mar 81, 77p Rept no. AFIT/GNE/PH/81M-1

In this study, Mossbauer spectroscopy was used to examine thermal aging of two metallic glasses. Fe80B20 was isothermally annealed at 573, 604, 611, and 626 K; and fe80P6.5C3.5B10 was annealed at 614, 716, and 744 K. The activation energy of Fe80B20, determined from the growth of alpha-Fe crystals, was 0.256 + 0.006 MJ/mole. The projected lifetime of this glass, based on the onset of crystallization, is 400 years. No quantitative data were obtained for Fe80P6.5C3.5B10; however, based on the higher temperature required for crystallization, it is expected to have a longer lifetime. (Author)

The Effect of High Pressure on Phase Relationships and Some Properties of Ti and Its alloys.
Final technical rept. Sep 78-Jan 81,
A. Rabinkin, and E. Gutmanas. May 81, 79p
Grant DA-ERO-78-G-112

This report summarizes research on phase transformations induced by the application of high pressure in Ti, Ti-Mo and Ti-V alloys. The relationship of microstructure, studied by TEM and quantitative X-ray diffraction analysis with mechanical properties and superconductive properties was found. The effect of alloying and pressurizing on phase stability correlates with changes in basic physical properties of phases. (Author)

The Effects of Ion Implantation on Friction and Wear of Metals.
Progress rept. Jan 80-Apr 81,
Nam P. Suh, and Sharon R. Shepard. May 81, 185p
Contract N00014-80-C-0255

The effect of ion implantation on the friction and wear behavior of metals was investigated. Experiments were conducted with iron, titanium, and copper implanted with nitrogen ions, iron implanted with aluminum ions, and copper implanted with zinc ions. The significant reduction in friction and wear of the iron and titanium systems is attributed to a hard layer formed during the ion implantation process. This hard layer minimizes plowing and subsurface deformation and hence reduces the delamination wear process, i.e. crack nucleation, crack propagation, and the formation of delamination wear sheets. A finite element model of an elastic semi-infinite solid under the contact of a stationary rigid asperity showed that the hard layer does not change the subsurface stress distribution by supporting the load, but rather that this thin layer decreases the plowing component of friction. The model predicts that this decrease in the friction coefficient in turn, substantially reduces subsurface deformation and thus wear. The implanted copper specimens which did not appear to have a hard surface layer showed little improvement in their tribological behavior over the unimplanted copper.

Internal Oxidation and Sulfidation of Iron-Based Binary Alloys.
P. J. Risse. May 81, 79p LBL-12785
Contract W-7405-ENG-48
Thesis.
Microfiche only after original copies are exhausted.

This project looks at internal oxidation and sulfidation, as one aspect of the coal gasification corrosion problem. By using different gas mixtures of H sub 2 S/H sub 2 O/H sub 2 /Ar the activities of the oxidants (oxygen and sulfur) are controlled to the point that iron, in the iron based binary alloys (Fe-1% Al, 5% Al, 1% Cr, 5% Cr), appears as a noble metal. The oxidants then diffuse into the noble iron matrix and interact, via precipitation, with the less noble elements, which allows depth of penetration analysis and morphology characterization to be performed. In the latter analysis, continuous subscales were formed both at the relatively high P/sub S2/ and at a low P/sub O2/, leaving a narrow range of potentials where the theories of Wagner are applied. The depth of penetration analysis yielded permeabilities (solubility-diffusivity) and effective diffusivity coefficients for the oxidants. 28 figures, 6 tables. (ERA citation 06:023034)

International conference on dislocation modeling of physical systems, Gainesville, FL, USA, 22 Jun 1980.
Microfiche only after original copies are exhausted.

A representative example of strengthening mechanism calculations is given. The critical stress necessary for a dislocation to cut through a row of equi-spaced voids was determined using anisotropic elasticity and the complete dislocation self force. The void-dislocation boundary conditions were treated by an approximate method. Based on the results, a simple correlation describing the critical stress was developed, and elastic anisotropy was included by means of effective values for the shear modulus and Poisson ratio. Dislocation self interaction is manifest as a critical line-tension cusp angle and a logarithmic cutoff parameter for the line energy. Voids are strong obstacles to dislocation motion, with critical stress values about 70% or more of the Orowan stress. (ERA citation 06:023893)

Jun 81, 39p ORNL/TM-7734/P1
Contract W-7405-ENG-26
Microfiche only after original copies are exhausted.

Candidate heat exchanger tube materials have been tested for times to 1500 h in a small-scale atmospheric fluidized-bed combustor (AFBC) operated by the FluiDyne Corporation of Minneapolis, Minnesota. The materials included alloys 800H and 600; types 304, 310, and 316 stainless steel; and aluminized alloy 800 and type 310 stainless steel. These air-cooled tubes were exposed to the AFBC environment with wall temperatures ranging from 810 to 875 exp 0 C, a Ca/S molar ratio of 3.3 to 5.3, 2.5 to 3.5% excess O sub 2 , and a fluidizing velocity of 0.7 m/s (2.3 fps). Tubes were removed for examination after 500 h of exposure and at the conclusion of the 1500-h test. In general, the materials performed well with moderate fireside scale formation and slight intergranular corrosion. The notabe exception was catastrophic corrosion of three alloy 600 tubes shortly after resumption of the test following the 500-h segment. (ERA citation 06:024060)

May 81, 51p SAND-80-1891
Contract AC04-76-DP00789
Microfiche only after original copies are exhausted.

A combined experimental/numerical analysis has been performed on the nonlinear response and ductile failure of 7075-T651 aluminum. The different specimen shapes which were tested and analyzed produced: (1) pure shear; (2) uniaxial; (3) biaxial; and (4) triaxial states of stress in an axisymmetric geometry. Experiments performed on these specimens were subsequently analyzed with large strain finite element calculations. The calculations closely modelled experimental behavior. The calculated stresses and strains were then used to study ductile multiaxial failure criteria for monotonic loading configurations. This study concludes that the strain at which 7075-T651 aluminum fails is dependent upon the existing triaxial stress field, the higher the triaxiality, the smaller the effective plastic strain at failure. The relationship between strain at failure and the degree of triaxiality is given by the failure criteria. (ERA citation 06:023913)

X-Ray Diffraction Studies of the Structure of La-Al-Ga Alloys.
A. Williams. Nov 80, 24p CALT-822-121
Contract AC03-76ER00822
Microfiche only after original copies are exhausted.

The La-La and La-Al partial atomic pair distribution functions have been determined for glassy La/sub 1-x/Al/sub x/ alloys from x-ray diffraction studies of isomorphous alloys of La/sub 1-x/Al/sub x/, La/sub 1-x/(AlGa)/sub x/, and La/sub 1-x/Ga/sub x/ for x = 0.20, 0.24, and 0.28. The atomic short range order of these La based metallic glasses is quite different from that of typical amorphous transition metal-metalloid alloys and from dense random packing models. A relatively short and well defined La-Al nearest neighbor distance suggests some covalency in the bonds between unlike atoms and possible chemical ordering in the alloys. (ERA citation 06:023892)

J. W. Davis. May 80, 13p COO-4247-3
Contract AS02-77ET52039
Portions of document are illegible.

High-energy neutron irradiation of Ti-6A1-4V results in extensive defect clusters, prismatic loops along with fine, ellipsoidal, 10 to 20 nm beta precipitates with orientation relationships)0001)/sub alpha / parallel)110)/sub beta / and <1120>/ sub alpha / parallel <111>/sub beta /. The beta precipitates redissolve upon annealing the irradiated alloy at 650 exp 0 C. The causes of beta precipitation were identified to be radiation-enhanced diffusion and radiation-induced segregation of the undersized beta stabilizing element, vanadium, to the defect clusters. The radiation-induced defect structure in the near-alpha alloys consists of a high density of defect clusters, a/3<1120> prismatic dislocation loops, and c-component dislocations and vacancy loops with no indication of beta precipitation. The increase in hardness as a result of irradiation is greater in Ti-6Al-4V than in the near-alpha alloys because of the precipitation strengthening by radiation-induced, fine, beta precipitates. The radiation damage of the alloys anneals out completely at 650 to 750 exp 0 C. (ERA citation 06:023906)

Oxidation Mechanisms for Alloys in Single-Oxidant Gases.
D. P. Whittle. Mar 81, 45p CONF-810347-2
Contract W-7405-ENG-48
NACE international conference on high temperature corrosion, San Diego, CA, USA, 2 Mar 1981.

Scales formed on alloys invariably contain the alloy constituents in a ratio different from that in the alloy, owing to the differing thermodynamic tendencies of the alloy components to react with the oxidant and to differences in diffusion rates in scale and alloy phases. This complex interrelationship between transport rates and the thermodynamics of the alloy-oxidant system can be analyzed using multicomponent diffusion theory when transport-controlled growth of single or multi-layered scales occurs. In particular, the superimposition of the diffusion data on an isothermal section of the appropriate phase diagram indicates the likely morphologies of the reaction products, including the sequence of phases found in the scale, the occurrence of internal oxidation and the development of an irregular metal/scale interface. The scale morphologies on alloys are also time-dependent: there is an initial transient stage, a steady state period, and a final breakdown, the latter often related to mechanical influences such as scale adherence, spallation, thermal or mechanical stresses and void formation. Mechanical influences have a more devastating effect in alloy oxidation due to the changes in alloy surface composition during the steady state period. (ERA citation 06:023911)

High Temperature Cyclic Oxidation Furnace Testing at NASA Lewis Research Center.
C. A. Barrett, and C. E. Lowell. 1981, 15p NASA-TM-81773, E833
Presented at the Symp. On Ind. Methods for Testing at High Temp. Environ., Phoenix, Ariz., 12 May 1981; Sponsored by American Society for Testing and Materials.

A standardized method of testing the cyclic oxidation resistance of various alloys in static air to 1200 C was developed and is routinely used at NASA Lewis Research Center. Test samples are automatically raised and lowered into a resistance wound furnace for a series of fixed interval heating and cooling cycles. Spall catchers collect the accumulated spall from each sample. The samples are weighed intermittently to generate specific weight change/time data. At various test times the samples and the accumulated spall are analyzed by X-ray diffraction. A computer program uses this gravimetric and X-ray data as input to print out the oxidation curves and specific weight change/time and X-ray results in a published format, organizes, and indexes the data. So far, several hundred Fe, Ni, and Co base alloys were tested using this same basic procedure and results form the basis of a series of cyclic oxidation handbooks to be published by NASA. Such specific weight change/time data were used to estimate the oxidative metal consumption by several computer modeling techniques to rank alloys and for use in life testing estimates.

Fretting Wear and Fretting Fatigue: How Are They Related.
R. C. Bill. 1981, 25p NASA-TM-82633, AVRADCOM-TR-81-C-16
Prepared in Cooperation with Army Aviation Research and Development Command, Cleveland, Ohio. Proposed for Presentation at the Joint Lubrication Conf., New Orleans, 4-7 Oct. 1981; Sponsored by American Society of Lubrication Engineer and Asme.

Results from published literature, and results obtained experimentally using a fretting wear apparatus are examined to determine how fretting wear and fretting fatigue are related. The effects of various experimental parameters including slip amplitude, number of fretting cycles, frequency of fretting motion, experimental atmosphere, temperature, and the performance of coatings and surface treatments are surveyed. All of the results examined indicate that fretting wear and fretting fatigue are influenced in a consistent and analogous manner by controlled variations in experimental conditions. That is, conditions that tend to accelerate fretting wear also accelerate fretting fatigue failures. Correlation of the performance of coatings on material under fretting wear and fretting fatigue conditions is rather tenuous, partly because similar contact conditions for fretting fatigue and fretting wear are not available for very many materials.

New Method of Preparation of Rare Earth Metals Carbothermal Reduction of Their Oxides.
G. Male. 1977, 23p
Contract W-7405-EN-26
A, Rev. Int. Hautes Temp. Refract. 14 P179-192 1977.

The study of the reduction of lanthanum sesquioxide (cerium group) and erbium sesquioxide (yttrium group) has been made versus the pressure of

carbon monoxide. It has shown the existence of two equilibrium reactions in the case of lanthanum, and of only one reaction for erbium. The relationship of equilibrium pressures to the temperature permitted the calculation of thermodynamic values of resulting carbides and oxicarbides. The lanthanum, neodymium, gadolinium, dysprosium, erbium and yttrium dicarbides were prepared by carbothermic reduction of the sesquioxides in solid state. Conditions for obtaining products containing very little oxygen were determined. The melting of these fritted carbides in the solar furnace decreases considerably both their amount of oxygen and their hydrolysability. This treatment improves also their homogeneity. Galvanic Deposition of Superinvar Alloys.
W. Alberth, A. F. Bogenshutz, J. L. Jostan, and A. Von Krusenstjern. 1975, 19p
Contract W-7405-ENG-48
A, Galvanotechnik, 66 n4 P291-300 1975.

The described galvanic method for depositing cylindrical superinvar hollow bodies is based on the use of a chloride-containing sulfate electrolyte and uses soluble iron, nickel and cobalt anodes, with a cathode current density of 10 A/dm exp 2 . The metal content of the electrolyte is about 100 g/l, the working temperature is 55 exp 0 C and the deposition rate is about 2.5 mu m/min. The chemical composition of the ternary alloys was varied in the range 66 to 76 wt % Fe, 24 to 30 wt % Ni and 0 to 6 wt % Co and included the desired superinvar alloy having 65 wt % Fe, 30 wt % Ni and 0 to 6 wt % Co, which is characterized by a very low linear expansion coefficient. For the galvanically produced alloy with 66.4 wt % Fe, 29 wt % Ni and 4.6 wt % Co, this value is < 2.87.10 exp -6 / exp 0 C after a thermal treatment and quenching treatment (in a temperature range 0 to 100 exp 0 C). Therefore, it is at least smaller by a factor of 1.3 than for binary invar alloys which were deposited galvanically. In both cases, due to electrocrystallization, we did not achieve the low expansion coefficients exactly as are known from invar and superinvar alloys produced by metallurgical melting. Additive Erosion Reduction Influences in the Turbulent Boundary Layer.
A. C. Buckingham. 6 May 81, 18p CONF-810549-1
Contract W-7405-ENG-48
Jannaf propulsion meeting, New Orleans, LA, USA, 26 May 1981.

Results of a sequence of flow, heat and mass transfer calculations are presented which theoretically characterize the erosive environment at the wall surface of refractory metal coated and uncoated gun barrels. The theoretical results include analysis of the wall surface temperature, heat flux, and shear stress time histories on thin (10 mil. or 0.254 mm) Cr, Mo, Nb, and Ta plated steel barrel walls as uncoated steel walls. The calculations combine effects of a number of separate processes which have been previously (and purposely) studied individually. These include solid particle additive concentrations, gas-wall thermo-chemical influences, and transient turbulent wall boundary layer flow with multi-component molecular diffusion and reactions from interaction of propellant combustion and the eroding surface. The boundary layer model includes particulate additive concentrations as well as propellant combustion products, considered for the present to be in the local thermochemical equilibrium. (ERA citation 06:023915)

Polyaromatic Esters.
Patent Application,
Paul Y. Chen. Filed 3 Mar 81, 20p AD-D008 529/0
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

New, easily processable, polyaromatic esters were prepared from 2,2'-diiododiphenyl-4,4'-dicarbonyl dichloride, isophthaloyl chloride and/or terephthaloyl chloride in combination with 4,4'-isopropylidene diphenol, 4,4'-sulfonyldiphenol, or resorcinol by interfacial condensation. In these polymers, phenylacetylenyl groups can be easily introduced into the polymer chain by replacing the iodine. This process leads to soluble and curable polymers from which films can be prepared. After curing the polymers are insoluble and show excellent thermal and chemical resistance. The curing process increases the polymers' softening temperature about 20 C. (Author)

Stable Model Reference Adaptive Control in the Presence of Bounded Disturbances,
Gerhard kreisselmeier, and Kumpati S. Narendra.
Mar 81, 20p Rept no. S/IS-8103
Contract N00014-76-C-0017

The adaptive control of a linear time-invariant plant in the presence of bounded disturbances is considered. In addition to the usual assumptions made regarding the plant transfer function, it is also assumed that the high frequency gain (kp) of the plant and an upper bound on the magnitude of the controller parameters, are known. Under these conditions the adaptive controller suggested assures the boundedness of all signals in the overall system.

A Theory of Interval Iteration.
Technical summary rept.,
L. B. Rall. Mar 81, 14p Rept no. MRC-TSR-2196
Contract DAAG29-80-C-0041

A theory of interval iteration, based on a few simple assumptions, is given for the fixed point problem for operators in partially ordered topological spaces. A comparison of interval with ordinary iteration is made which shows that their properties are converse in a certain sense with respect to existence or nonexistence of fixed points. The theory of interval iteration is shown to hold without modification if the computation is restricted to a finite set of points, as in actual practice. In this latter case interval iteration is show to converge or diverge in a finite number of steps, for which an upper bound is given. By the introduction of a suitable iteration operator, the method of interval iteration is extended to the problem of solution of equations in linear spaces. (Author)

Resonance through a Strictly Singular Perturbation.
Technical summary rept.,
Ketill Ingolfsson. Apr 81, 17p Rept no. MRC-TSR-2202
Contract DAAG29-80-C-0041

As a consequence of the formal difficulties in explaining resonances as solutions of the general Schroedinger equation, the procedure developed here exploits some fairly general properties of a semigroup, appropriate for the decay. A feature, which in this context may be named as 'the paradox of resonance', will be analyzed to some extent. By generalizing the time development one can, however, formulate the resonant state in a consistent way. Its definition will be interpreted along the lines of strictly singular perturbations. An Extension to Rational Functions of a Theorem of J. L. Walsh on Differences of Interpolating Polynomials.
Technical summary rept.,
E. B. Saff, A. Sharma, and R. S. Varga. Apr 81, 32p Rept no. MRC-TSR-2204
Contract DAAG29-80-C-0041, Grant AFOSR-80-0226
Sponsored in part by Grants DE-AS02-76ERO-2075 and NSF80-0226.

In this paper, a theorem of J. L. Walsh, on differences of polynomials interpolating in the roots of unity and in the origin, is extended to differences of rational functions interpolating in more general sets. The original result of Walsh is described. Our generalization of Walsh's theorem is in two directions. First, we show that an analogous overconvergence holds for differences of rational interpolants to meromorphic functions F(z). Second, we show that the defining interpolation points can be considerably more general than the roots of unity and the origin. Finally, several concrete examples of our generalization are given, one consisting in applications of Faber polynomials.

The Numerical Solution of Boundary Value Problems on 'Long' Intervals.
Technical summary rept.,
Peter A. Markowich, and Christian A. Ringhofer. Apr 81, 40p Rept no. MRC-TSR-2205
Contract DAAG29-80-C-0041, Grant NSF-MCS79-27062

This paper deals with the numerical solution of boundary value problems of ordinary differential equations posed on infinite intervals. The solution of these problems proceeds in two steps. The first is to cut the infinite interval at a finite, large enough point and to insert additional, so called asymptotic boundary conditions at the far (right) end; the second is to solve the resulting two point boundary value problem by a numerical method, for example a difference scheme. In this paper the Box-scheme is investigated. Numerical problems arise, because standard algorithms use too many grid points as the length of the interval increases. An 'asymptotic' a priori mesh size sequence which increases exponentially, and which therefore only employs a reasonable number of meshpoints, is developed. Through investigating the conditioning of the (linearized) Box-scheme, we find that the solutions can be obtained safely by the Newton procedure when partial pivoting is employed.

Convergence of Periodic Wavetrains in the Limit of Large Wavelength.
Technical summary rept.,
Jerry L. Bona. Apr 81, 18p Rept no. MRC-TSR-2206
Contract DAAG29-80-C-0041

The korteweg-de Vries equation was originally derived as a model for unidirectional propagation of water waves. This equation possesses a special class of traveling-wave solutions corresponding to surface solitary waves. It also has permanent-wave solutions which are periodic in space, the so-called cnoidal waves. A classical observation of Korteweg and de Vries was that the solitary wave is obtained as a certain limit of cnoidal wavetrains. This results is extended here, in the context of the Korteweg-de Vries equation. It is demonstrated that a general class of solutions of the Korteweg-de Vries equation is obtained as limiting forms of periodic solutions, as the period becomes large. (Author)

Completeness of Derivatives of Squared Schroedinger Eigenfunctions and Explicit Solutions of the Linearized KdV Equation.
Technical summary rept.,
Robert L. Sachs. Apr 81, 23p Rept no. MRC-TSR-2207
Contract DAAG29-80-C-0041

Explicit solutions to the Cauchy problem for the linearized Kortweg-deVries (KdV) equation are constructed when the initial data is integrable. The method is analogous to the Fourier decomposition for a constant coefficient equation and uses the connection between the one-dimensional Schroedinger equation and the KdV equation, as discovered by Gardner, Greene, Kruskal, and Miura. An expansion theorem expressing any integrable function in terms of derivatives of squared Schroedinger (generalized) eigenfunctions is proved. These functions evolve according to the linearized KdV equation, hence the expansion of the initial data leads to a generalized solution of the linearized KdV equation. Under suitable restrictions on the initial data, the solution constructed is classical. The proof of the expansion theorem may be interpreted as the skew-adjoint analogue of the more familiar process of simultaneously diagonalizing two self-adjoint operators. (Author)

A Justification of the KdV Approximation to First Order in the Case of N-Soliton Water Waves in a Canal.
Technical summary rept.,
Robert L. Sachs. Apr 81, 50p Rept no. MRC-TSR-2208
Contract DAAG29-80-C-0041, Grant NSF-MCS77-01986

We consider the Euler equations for a perfect fluid in a flat-bottomed canal in the time-dependent case. A formal expansion procedure for small amplitude, long waves analogous to that of Friedrichs and Hyers for solitary waves is developed and leads to the Korteweg-de Vries equation (KdV for short) for the lowest order term. The higher order terms in the expansion satisfy the inhomogenous version of the linearized KdV equation. Of particular interest to us are those solutions of the KdV equation called N-solitons, which asymptotically separate into N travelling waves with distinct speeds. Using certain facts about the linearized

KdV equation and some properties of the N-solitons, we prove that the next term in this expansion can be uniquely specified by certain asymptotic conditions and a symmetry requirement. This solution behaves like an N-solition; asymptotically, it separates into N travelling waves with the same speeds and phases as those of the leading term. (Author)

Nonlinear Eigenvalue Problems on Infinite Intervals.
Technical summary rept.,
Peter A. Markowich, and Richard Weiss. Apr 81, 34p Rept no. MRC-TSR-2199
Contract DAAG29-80-C-0041, Grant NSF-MCS79-27062

This paper is concerned with nonlinear eigenvalue problems of boundary value problems for ordinary differential equation posed on an infinite interval. It is shown that under certain analyticity assumptions - a domain in the complex plain can be identified, in which all eigenvalues are isolated. An intriguing way to solve such problems is to cut the infinite interval at a finite but large enough point and to impose additional, so called asymptotic boundary conditions at this far end. The obtained eigenvalue problem for the two point boundary value problem on this finite but large interval can be solved by an appropriate code. In this paper suitable asymptotic boundary conditions are devised and the order of convergence, as the length of the interval, on which these approximating problems are posed, converges to infinity, is investigated. Exponential convergence is shown for well posed approximating problems. (Author)

A Note on the Asymptotic Behavior of Nonlinear Semigroups and the Range of Accretive Operators.
Technical summary rept.,
Simeon Reich. Apr 81, 20p Rept no. MRC-TSR-2198
Contract DAAG29-80-C-0041

It is known that certain problems in partial differential equations may be interpreted as initial value problems for ordinary differential equations in Banach spaces. When such an evolution equation is governed by an accretive operator, then its solutions give rise to a nonlinear contraction semigroup. In this paper we study certain aspects of the asymptotic behavior of nonlinear semigroups and or resolvents of accretive operators. We also derive new results on their behavior at the origin. It turns out that the behavior of a nonlinear semigroup resembles that of the resolvent of its generator both at infinity and at the origin. (Author)

Norman L. Johnson, and Samuel Kotz. Jul 81, 14p Rept no. MIMEO SER-1342
Contract N00014-81-K-0301, Grant NSF-MCS80-21704

'Relevation' is the name given by Krakowski to the distribution of failure time of a replacement from an aging stock. The present authors (Johnson and Kotz) have extended this concept to include (1) hierarchal replacement systems and (2) dependence between lifetimes of original and replacement items. In this paper, we present some further developments, including first steps towards a synthesis of (1) and (2).

Nonstandard Distributions in Two-Stage Least Squares.
Research rept.,
Mark Marcucci, and D. R. Jensen. May 81, 26p RR-Q-9, ARO-15194.9-M
Grant DAAG29-78-G-0172

In estimating the coefficient of an endogenous variable in a single equation of a system of linear equations, Anderson and Sawa (1973) expressed the distribution of the two-stage least-squares (TSLS) estimator as a doubly noncentral F distribution. We relax their assumption of independent Gaussian errors, taking instead a scale mixture of spherical Gaussian laws in a class containing the spherical stable distributions. The resulting distribution of the TSLS estimator is a mixture of doubly noncentral F distributions mixed over the noncentrality parameters, and for suitable mixtures the normal-theory distribution is robust. Computations reported for contaminated spherical Gaussian and spherical Cauchy errors are compared with the standard case. (Author)

Efficient Computer Implementations of Fast Fourier Transforms.
Master's thesis,
John David Blanken. Dec 80, 19p Rept no. AFIT/GE/EE/80D-9
Availability: Microfiche copies only.

A comprehensive comparison of the most efficient Discrete Fourier Transform (DFT) techniques is presented. The DFT algorithms selected are the fixed radix Fast Fourier Transform (FFT), mixed radix FET, the Winograd Fourier Transform Algorithm (WFTA), and the Prime Factor Algorithm (PFA). Comparison of the algorithms is based on the number of real multiplications, additions, and memory arrays required as a function of sequence length N. This paper reviews the literature, selects the most efficient DFT FORTRAN programs available, develops the number of real multiplications and additions as a function of N, and compares the algorithms using tables and plots of real multiplications, additions, and memory arrays. Comparison shows that the WFTA and PFA require the least real multiplications and additions, but the fixed radix and mixed radix FFTs require the least memory. The mixed radix FFT is much more flexible than WFTA or PFA since N can be any length sequence. The WFTA and PFA are closely studied and tradeoffs between the two are discussed. Based on the results of the paper, an algorithm is presented to select the most efficient DFT for an N length sequence given the multiply speed, add speed, and memory size of the computer.

Analytical and Numerical Problems Associated with Extending the Use of the Second order Even-parity Transport Equation.
Doctoral thesis,
John C. Souders, Jr. Jun 81, 137p Rept no. AFIT/DS/PH/81-2

The purpose of this research was to determine the feasibility of extending the use of the even-parity form of the Boltzmann Equation (EPFBE) to complex linear transport problems. Previous applica-

tions had been limited to problems involving simple geometry and low order scatter approximations. The air-over-ground problem was selected for this more complex extension since it required two-dimensional cylindrical geometry, anisotropic scatter, and a multigroup solution. To eliminate the ray effect in this problem, both the finite element and synthesis method were used. With these methods the Galerkin and collocation numerical techniques were applied. The Galerkin method proved infeasible because the integrals that resulted could not be efficiently evaluated either numerically or analytically. The collocation method allowed the analytic evaluation of all derivative and integral operations, but forced a fixed anisotropy on the solution. The multigroup method applied to the EPFBE produced a nested integral problem that increased proportionately with the number of energy groups. This research demonstrated that the finite element method can not be cost effectively used in solving the EPFBE for transport problems requiring complex geometries, anisotropic scatter, and a multigroup method. Criteria developed during this research for pursuing future work with the EPFBE is presented. (Author)

An Interactive Program for the Calculation and Analysis of the Parameter Sensitivities in a Linear, Time-Invariant System.
Master's thesis,
Linda Kneen Palmer. Mar 81, 111p Rept no. AFIT/GA/EE/81M-1

In this paper, a new algorithm is developed to calculate the output 'sensitivity matrix' of a linear, time-invariant, single-input single-output control system with piecewise constant input and output measurements taken at constant time intervals. The algorithm incorporates the singular value decomposition to investigate parameter identifiability and estimation accuracy in relation to the system as a whole and in relation to the model of the system. As a result, a structural condition on identifiability is imposed; and the system designer now has a tool to evaluate how well the model describes the system. The algorithm is verified by checking its results with those using a standard software package for numerical integration. It is then used to investigate input and structural design issues. (Author)

Complex Planar Splines.
Interim rept.,
Gerhard Opfer, and Madan L. Puri. May 81, 38p
Contract N00014-77-C-0659

In contradistinction to the known theory on complex splines which are defined on the boundary of a region and then extended into the interior by Cauchy's integral formula. We define complex planar splines on a region itself as a complex valued continuous function which is defined piecewise on suitable meshes of that region. The main idea is to use non-holomorphic functions as pieces, since holomorphic pieces would lead to just one holomorphic function on the whole region by a well known identity theorem in the theory of functions in one complex variable. Some of the techniques used are available from the theory of finite elements. But also are considered new aspects, namely mapping properties of a complex planar spline v and the difference f - v where f is in general a holomorphic function. For triangular, rectangular, parallelogram meshes and meshes on circular sectors, explicit expressions are provided and also properties of the newly introduced complex planar splines are studied.

International Conference on Applied Probability Models for Complex Stochastic Systems, Held at Jane S. McKimmon Center, North Carolina State University Raleigh, North Carolina on January 8-9, 1981.
Final rept.
1981, 37p ARO-18119.1-M
Contract DAAG29-81-M-0043

The purpose of the conference was to bring together several prominent mathematicians and engineers from Europe and the U.S. with common interests in applied probability models for complex stochastic systems, to interchange ideas with one another and with faculty, students, and researchers at the universities and research organizations in the Research Triangle area. Primary emphasis was placed on two topics: (1) distribution-free analysis of complex stochastic systems; and (2) optimal control of complex stochastic systems. This emphasis was motivated by the need for mathematical models to help describe and control such complex stochastic systems as networks of queues, such as arise in computer and communication systems and industrial job shops, and operating systems composed of parts subject to maintenance, failure, and replacement, such as arise in aerospace and military applications.

Preconditioned Conjugate-Gradient Methods for Nonsymmetric Systems of Linear Equations.
research rept.,
Howard C. Elman. Apr 81, 14p Rept no. RR-203
Contract N00014-76-C-0277
Prepared in cooperation with Florida State Univ., Contract N00014-80-C-0076.

In this paper, we present a class of iterative descent methods for solving large, sparse, nonsymmetric systems of linear equations whose coefficient matrices have positive-definite symmetric parts. Such problems commonly arise from the discretization of non-self-adjoint elliptic partial differential equations. The methods we consider are modelled after the conjugate gradient method. They require no estimation of parameters and their rate of convergence appears to depend on the spectrum of A rather than ATA. Their convergence can also be accelerated by preconditioning techniques.

The Asymptotic Behavior of Monotone Percentile Regression Estimates,
F. T. Wright. 28 May 81, 16p Rept no. 4
Contract N00014-80-C-0322, Grant NSF-MCS78-01514

The least absolute deviations estimate of a monotone regression function was derived by Robertson and Waltman (1968). Assuming the observation points become dense in the domain of the regression function, Casady and Cryer (1976) obtained an upper bound on the almost sure rate of convergence of the estimator. The asymptotic distribution of the estimator at a point is obtained here and a faster rate of convergence is obtained. (Author)

On the Problem of Selecting Good Populations.
Mimeograph series,
Woo-Chul Kim. Aug 80, 41p Rept no. MMS-80-20
Contract N00014-75-C-0455
Prepared in cooperation with Seoul National Univ. (Korea).

The problem of selecting good populations out of k normal populations is considered in a Bayesian framework under exchangeable normal priors and additive loss functions. Some basic approximations to the Bayes rules are discussed. These approximations suggest that some well-known classical rules are 'approximate' Bayes rules. Especially, it is shown that Gupta-type rules are extended Bayes with respect to a family of the exchangeable normal priors for any bounded and additive loss function. Furthermore, for a simple loss function, the results of a Monte Carlo comparison of Gupta-type rules and Seal-type rules are presented. They indicate that, in general, Gupta-type rules perform better than Seal-type rules. (Author)

Some Results in the Theory of Subset Selection Procedures.
Mimeograph series,
Hwa-Ming Yang. Aug 80, 139p Rept no. MMS-80-22
Contract N00014-75-C-0455

Selection and ranking (ordering) problems in statistical inference arise mainly because the classical tests of homogeneity are often inadequate in certain situations where the experimenter is interested in comparing k ($>$ or $=$ 2) populations, treatments or processes with the goal of selecting one or more worth-while (good) population. Chapter I of this thesis considers the problem of selecting a subset containing all populations that are better than a control under the assumptions of an ordering prior. Here, by an ordering prior we mean that there exists a known simple or partial order relationship among the unknown parameters of the treatments (excluding the control). Three new selection procedures are proposed and studied. These procedures do meet the usual requirement that the probability of a correct selection is greater than or equal to a pre-determined number P^*. Two of the three procedures use the isotonic regression over the sample means of the k treatments with respect to the given ordering prior. Tables which are necessary to carry out the selection procedure with isotonic approach for the selection of unknown means of normal populations and gamma populations are given. Monte Carlo comparisons on the performance of several procedures for the normal or gamma means problem were carried out in several selected cases. The results of this study seem to indicate that the procedures based on isotonic estimators always have superior prformance, especially, when there are more than one bad population (in comparison with the control).

On Two-Stage Prodcedures for Finding A Population Better than a Control.
Mimeograph series,
Klaus J. Miescke. Sep 80, 25p Rept no. MMS-80-28
Contract N00014-75-C-0455
Prepared in cooperation with Mainz Univ. (Germany, F. R.).

A natural class of two-stage procedures is proposed which can be completely described and studied in terms of Neyman-Pearson testing theory, where the unsymmetry of tests, however, can be overcome to a considerable extent. As a typical result it is shown that optimality of tests carries over to optimality of two-stage procedures. Finally, under normality, comparisons are made in case of k = 2 with certain Bayesian procedures.

Optimal Outlier Tests for a Weibull Model - To Identify Process Changes or to Predict Failure Times.
Technical paper 1 Jul 80-1 Jun 81,
Nancy R. Mann. May 81, 21p
Contracts N00014-80-C-0684, N00014-76-C-0723

Weibull outlier tests based on three different statistics are investigated with respect to their power optimality under various alternative models. Two of thes statistics are new in the context of outlier statistics; and one of these is shown to provide a more powerful test in certain situations than other more classical outlier test statistics. Critical values of the three statistics were computer-generated and are tabulated. The tabulated values allow one to identify 'treatment effects' resulting from unsuspected modifications to a process or to predict failure times in a life test. Numerical examples are given. A Good Simple Percentile Estimator of the Weibull Shape Parameter for Use When all Three Parameters Are Unknown.
Technical paper 1 Sep 80-1 Apr 81,
Stelios H. Zanakis, and Nancy R. Mann. Mar 81, 17p
Contracts N00014-80-C-0684, N00014-76-C-0723
Prepared in cooperation with Florida International Univ., Miami. Dept. of Management and California Univ. at Los Angeles. Dept. of Biomathematics.

In this paper we consider a simple three-order-statistic asymptotically unbiased estimator of the Weibull shape parameter c for the case in which all three parameters are unknown. Optimal quantiles that minimize the asymptotic variance of this estimator c-tilde, are determined and shown to depend only on the true (unknown) shape parameter value c and in a rather insensitive way. Monte Carlo studies further verified that, in practice where the true shape parameter c is unknown, using always c-tilde with the optimal quantities that correspond to c=2.0 produces estimates, c-tilde-asterisk, remarkably close to the theoretical optimal. A second stage estimation procedure, namely recalculating c-tilde based on the optimal quantiles corresponding to c-tilde-asterisk, was not worth the additional effort. Benchmark simulation comparisons were also made with a new estimator of Wyckoff, Bain and Engelhardt (1980), one that appears to be the best of proposed closed-form estimators that use all sample observations. The proposed estimator, c-tilde-asterisk, should be of interest to practitioners having limited resources and to researchers as a starting point for more accurate iterative estimation procedures. It is independent of all three Weibull parameters and, for moderate sample sizes, it requires only the first, last and one other (early) ordered observation. (Author)

Subjective Transfer Function Approach to Complex System Analysis.
Interim rept.,
Clairice T. Veit, and Monti Callero. Mar 81, 45p
Rept no. RAND/R-2719-AF
Contract F49620-77-C-0023

The subjective transfer function (STF) approach, a new procedure for analyzing complex systems that involve numerous cause and effect relationships among the system components, is described. A tactical air command and control and force employment system is used to illustrate measurement problems found with other procedures commonly used in complex system analyses and their resolutions in the STF approach. In the STF approach, systems 'experts' are involved in defining the complex system components and constructing their network of cause and effect relationships. Each hypothesized relationship is transformed into an STF that specifies how described components affect judged outcomes. The STFs are tested by using proper experimental designs in generating questionnaires that are given to 'experts.' Decisions are then made about the appropriateness of the initially hypothesized system components and the form of the STF. Appropriate STFs are used to assess how changes in the system affect system outcomes. (AUTHOR)

Statistics of Nonlinearly Transformed Coherence Estimates.
Technical rept.,
Albert H. Nuttall. 12 Mar 81, 43p Rept no. NUSC-TR-6445

An asymptotic relation for the average value of any nonlinear transformation of a magnitude-squared-coherence estimate is derived. It is utilized to determine the bias, variance, and mean-square error of the transformed coherence estimate. It is found that the arc tanh (x(1/2)) transformation is the only one with variance independent of the true coherence value to O(N(-1)), and that the 1n(x) transformation is the only one with zero bias, to exponential order in N. Here, N is the number of data pieces employed in the estimation of the coherence. Extensions to terms of O(N(-2)) are made and presented for a v-th law device also. (Author)

Algorithms for Sparse, Symmetric, Definite Quadratic lambda-Matrix Eigenproblems.
D. S. Scott, and R. C. Ward. 1981, 8p
Contract W-7405-ENG-26
1981 army numerical analysis and computers conference, Huntsville, AL, USA, 26 Feb 1981.

Methods are presented for computing eigenpairs of the quadratic lambda-matrix, M lambda exp 2 + C lambda + K, where M, C, and K are large and sparse, and have special symmetry-type properties. These properties are sufficient to insure that all the eigenvalues are real and that theory analogous to the standard symmetric eigenproblem exists. The methods employ some standard techniques such as partial tri-diagonalization via the Lanczos Method and subsequent eigenpair calculation, shift-and- invert strategy and subspace iteration. The methods also employ some new techniques such as Rayleigh-Ritz quadratic roots and the inertia of symmetric, definite, quadratic lambda-matrices. (ERA citation 06:024524)

A Generalized Assignment Heuristic for Vehicle Routing.
Marshall L. Fisher, and Ramchandran Jaikumar. Aug 79, 33p Rept no. 79-10-04
Contract N00014-78-C-0302

We consider a common variant of the vehicle routing problem in which a vehicle fleet delivers products stored at a central depot to satisfy customer orders. Each vehicle has a fixed capacity, and each order uses a fixed portion of vehicle capacity. The routing decision involves determining which of the demands will be satisfied by each vehicle and what route each vehicle will follow in servicing its assigned demand in order to minimize total delivery cost. We present a heuristic for this problem in which an assignment of customers to vehicles is obtained by solving a generalized assignment problem with an objective function that approximates delivery cost. This heuristic has many attractive features. It has outperformed the best existing heuristics on a sample of standard test problems. It will always find a feasible solution if one exists, something no other existing heuristic can guarantee. It can be easily adapted to accommodate many additional problem complexities. By parametrically varying the number of vehicles in the fleet, our method can be used to optimally solve the problem of finding the minimum size fleet that can feasibly service the specified demand. Vehicle Routing Algorithms for Local Delivery at Naval Supply Centers.
Master's thesis,
Clifford O. Clausen. Mar 81, 132p

This thesis examines the local delivery operations at the Naval Supply Centers in Oakland and San Diego. The local delivery problem is formulated as a model applicable to these supply centers. Specifically, the model involves routing a fleet of vehicles from a central depot to each of a set of customers so as to satisfy their demands. Twelve heuristic solution methods applicable to this model are reviewed and illustrated with examples. They are also compared with respect to quality of resulting solutions and computational efficiency. Finally, recommendations on improving the routing of vehicles at the two Naval Supply Centers are made. (Author)

Ground Coupling and Single-Blow Thermal Storage in a Double-Envelope House.
H. T. Ghaffari, and R. F. Jones. 1981, 6p CONF-810509-29
Contract AC02-76CH00016
Annual conference of the International Solar Energy Society, Philadelphia, PA, USA, 26 May 1981.

The possibility of ground thermal storage and coupling in a double-shell house is investigated. Temperature distribution in the ground, utilizing measured ground temperatures, is obtained, and the amount of heat retrieval is assessed. One experimental model and several hypothetical models are introduced; their effects and advantages are compared. (ERA citation 06:022169)

Development Support by ORNL for TVA AFBC Pilot Plant.
R. S. Holcomb, M. E. Lackey, C. S. Daw, and G. P. Zimmerman. 1981, 14p
Contract W-7405-ENG-26
64. chemical conference, Halifax, Nova Scotia, Canada, 31 May 1981.

Oak Ridge National Laboratory (ORNL) has been involved for the past several years in the assessment, design and development of fluidized bed combustors. The current effort includes a development program for an AFBC-gas turbine industrial cogeneration plant, a PFBC utility plant assessment and design study, and technical and development support for the TVA Pilot Plant program. The FBC experience and R and D capabilities of ORNL complement the power plant design, construction and operating experience of TVA in the AFBC Pilot Plant program. The technical support provided by ORNL includes a number of analytical and experimental tasks in several area of AFBC technology. The major development effort has been in the areas of combustion performance and coal feeding. Sulfur capture performance data have been obtained in the ORNL Bench Scale Combustor for candidate limestones with once-through feeding and with fines recycle. The target performance of 90% SO sub 2 retention was achieved with a Ca/S mole ratio of 2.1 with fines recycle. A fundamental test program on the pneumatic transport of coal and coal-limestone mixtures was conducted to investigate the influence of particle size distribution, surface moisture and transport velocity, on pressure drop, saltation and plugging. Air Infiltration in Buildings.
M. H. Sherman. Oct 80, 125p LBL-10712
Contract W-7405-ENG-48
Thesis.
Microfiche only after original copies are exhausted.

A physical model of infiltration in buildings that can be used to predict the infiltration for a wide range of construction types and climate regions is presented. The problems associated with commonly-used tracer gas methods for measuring infiltration were examined in detail so that results obtained from the model could be properly compared with actual measurements. In addition, a simple model of the hydrodynamics of typical leaks in the building envelope was devised in order to study the physical processes of infiltration (i.e., the flow of air through cracks in the structure of the building). Finally, a method for quantifying the leakage of the building envelope (the quantity analogous to envelope thermal conductance) was developed. The name given to this measurement technique is AC pressurization. Although other methods exist for measuring the leakage of a building envelope, AC pressurization is far more accurate and can be used at lower pressures than any existing methods. The model, based on the determination of the effective leakage area, was used to predict the infiltration at 15 separate sites. Pressurization was used to calculate leakage area and then was used to calculate infiltration. Findings were then compared to direct measurements of infiltration at the sites. Agreement between the model and direct measurement by tracer gas techniques was +- 20% overall - a degree of accuracy far surpassing any previous model of infiltration capable of being generally applied. Seasonal Performance of Air Conditioners - an Analysis of the DOE Test Procedures: The Thermostat and Measurement Errors. Report No. 2.
G. D. Lamb, and D. R. Tree. Jan 81, 194p
Contract AC02-80CS23337

Two aspects of the DOE test procedures are analyzed. First, the role of the thermostat in controlling the cycling of conditioning equipment is investigated. The test procedures call for a cycling scheme of 6 minutes on, 24 minutes off for Test D. To justify this cycling scheme as being representative of cycling in the field, it is assumed that the thermostat is the major factor in controlling the cycle rate. This assumption is examined by studying a closed-loop feedback model consisting of a thermostat, a heating/cooling plant and a conditioned space. Important parameters of this model are individually studied to determine their influence on the system. It is found that the switch differential and the anticipator gain are the major parameters in controlling the cycle rate. This confirms the thermostat's dominant role in the cycling of a system. The second aspect of the test procedures concerns transient errors or differences in the measurement of cyclic capacity. In particular, errors due to thermocouple response, thermocouple grid placement, dampers and nonuniform velocity and temperature distributions are considered. Problems in these four areas are mathematically modeled and the basic assumptions are stated. Results from these models help to clarify the problem areas and give an indication of the magnitude of the errors involved. It is found that major disagreement in measured capacity can arise in these four areas and can be mainly attributed to test set-up differences even though such differences are allowable in the test procedures. An understanding of such differences will aid in minimizing many problems in the measurement of cyclic capacity. (ERA citation 06:023707)

Low-Cost Evacuated-Tube Solar Collector. Final Report.
10 Feb 81, 262p
Contract AC04-78CS30133

A prototype design for an evacuated tube air cooled solar collector module has been completed. A product cost study, based on the production of 60,000 of the prototype modules per year (approx. 1,000,000 square feet annually), estimates that the module as shipped would have a cost at inventory of $7.09 to $7.40 per square foot of aperture. Computer programs were developed to predict the optical and thermal performance of the module. Antireflective coatings (porous aluminum oxide) which could be formed by spraying or dipping were demonstrated but degraded more rapidly when exposed to a high humidity ambient than acid etched films. A selective black chromium oxide multi-layered graded film was vapor deposited which had an absorptivity of about 0.9 and an emissivity of 0.03. When the film was heated to temperatures of 400 exp 0 C in a gettered vacuum for as little as 24 hours, however, irreversible changes took place both between and within coating layers which resulted in alpha decreasing to about 0.73 and epsilon increasing to 0.14. The product cost studies indicate that module design changes are warranted to reduce product cost prior to tooling for production. (ERA citation 06:021937)

Analytical Selection of Marketable SAHP Systems. Final Report, September 30, 1977-December 31, 1979.
W. Kahan. Jan 80, 184p SAN-1467-1
Contract AC03-77CS31467

For the effective marketing of energy conserving heating systems which have high initial costs, such as the solar assisted heat pump (SAHP), it is imperative to identify those climatic regions, load profiles, and system characteristics for which such systems are economically promising. This report summarizes efforts to develop a quick and efficient means of performing this identification. These efforts were separated into two distinct studies, a marketing study and a technical study of five energy conserving systems; and stand-alone heat pump, a stand-alone solar energy system, and a series, a parallel, and a dual source SAHP system. One of the primary results of the marketing study was the identification of the portion of the HVAC market into which the initial marketing thrust of these systems should be concentrated. In addition, several factors which influence the sales of these systems were identified. The technical study concentrated on the development and use of an analytical model of each of the systems. This model was designed to quickly size, in a specific climatic region, the system components for an economic optimum; i.e., for a minimum life cycle cost. Then the one energy conserving system which has the lowest life cycle cost, and thus the best potential, can be identified. It was found that, at present costs of electricity, the air-to-air heat pump has the lowest life cycle cost and hence is considered most marketable. At significantly higher electricity costs, the series SAHP system is the most marketable one because it has the lowest life cycle cost of the five energy conserving systems studied. Direct Contact Liquid-Liquid Heat Exchanger for Solar Heated and Cooled Buildings. Final Report, January 1, 1979-May 30, 1980.
S. Karaki, and P. Brothers. Jun 80, 161p COO-2867-8
Contract AS02-76CS32867

The technical and economic feasibility of using a direct contact liquid-liquid heat exchanger (DCLLHE) storage unit in a solar heating and cooling system is established. Experimental performance data were obtained from the CSU Solar House I using a DCLLHE for both heating and cooling functions. A simulation model for the system was developed. The model was validated using the experimental data and applied in five different climatic regions of the country for a complete year. The life-cycle cost of the system was estimated for each application. The results are compared to a conventional solar system, using a standard shell-and-tube heat exchanger. It is concluded that while thare is a performance advantage with a DCLLHE system over a conventional solar system, the advantage is not sufficiently large to overcome slightly higher capital and operating costs for the DCLLHE system. (ERA citation 06:023353)

Development of a High Performance Air Heater Through Use of an Evacuated Tube Cover Design. Final Report.
D. E. Jones, L. E. Shaw, and G. O. G. Loef. 1981, 137p
Contract AC04-78CS34193

Work leading to the development of a high performance air heater through use of an evacuated tube cover design is detailed. Work consisted of a literature survey, fabrication of the tubes, solar transmittance tests, thermal conductance tests, collector design, prototype construction; prototype testing, and finally performance and cost evaluation. Two types of evacuated tubes were manufactured, clear tubes and tubes with an infrared reflective coating. The tubes were arranged parallel in a close packed flat array to form a transparent cover for the collector. The array transmittance of clear tubes is similar to that of two flat sheets of low absorptance glass. The coated tube array had substantially reduced transmittance. Thermal conductance tests indicated that the tube arrays perform similar to two flat sheets of glass with an evacuated space. Convection off the lower and upper surface of the tube arrays was enhanced by the larger surface area which somewhat offset the advantage of the vacuum. Two prototype collectors were designed, built, and tested: (1) clear tube array over a selective surface; (2) coated tube array over a non-selective surface. The collectors were tested side by side with two baseline collectors, a selective surface collector without a tube array and a standard Solaron collector. Test results indicate the tube collector performs better at higher temperatures than either baseline or the coated tube collector, but the performance increase is not outstanding. Inclusion of the evacuated tube cover concept is probably not cost competitive with other collectors in either the high or low temperature range. (ERA citation 06:023374)

Pulverized Coal Firing of Aluminum Melting Furnaces. Second Annual Technical Progress Report, July 1979-June 1980.
C. E. West, and D. L. Stewart. Aug 80, 43p
Contract AC01-78CS40037

The ultimate objective of this program is the commercial demonstration of an efficient, environmentally acceptable coal firing process suitable for implementation on melting furnaces throughout the aluminum industry. To achieve this goal, the program has been divided into two phases. Phase I has proceeded through design and construction of a 350 pound (coal) per hour staged slagging cyclone combustor (SSCC) attached to a 7-ft diameter aluminum melting ladle furnace. Process development will culminate with a 1000 pph prototype SSCC firing a 40,000 pound capacity open hearth melting furnace at the Alcoa Laboratories. Phase II implementation is currently planned for Alcoa's Lafayette, IN, Works, where two of the ingot plant's five open hearth melting furnaces will be converted to utilize coal. In addition to confirmation of data gathered in Phase I, the effect of extended production schedule operation on equipment and efficiencies will be determined. This work would begin in 1982 pursuant to technical and economic evaluation of the process development at that time. (ERA citation 06:023074)

Rivesville Multicell Fluidized Bed Boiler. Annual Technical Progress Report. July 1978-June 1979.
Aug 80, 305p
Contract AC21-81MC16230

Design, construction and test program of a 300,000 lb/hr steam generating capacity multicell fluidized bed boiler (MFB), as a pollution free method of burning high-sulfur or highly corrosive coals, is being carried out. The concept involves burning fuels such as coal, in a fluidized bed of limestone particles that react with the sulfur compounds formed during combustion to reduce air pollution. Nitrogen oxide emissions are also reduced at the lower combustion temperatures. The CaSO sub 4 produced in the furnace is discharged with the ash or regenerated to CaO for reuse in the fluidized bed. Information is presented on continued operation of the Rivesville MFB steam generating plant in a commercial mode and for determining performance and emission characteristics; studies and tests on flyash characterization and reinjection, fuel feed eductors and needles, air distributor, corrosion-erosion and sulfur capture; engineering studies to improve MFB performance and reliability. Pope, Evans, and Robbins, Inc., New York.
Rivesville Multicell Fluidized Bed Boiler.
Mar 81, 83p
Contract AC21-81MC16230

One objective of the experimental MFB at Rivesville, WV, was the evaluation of alternate feed systems for injecting coal and limestone into a fluidized bed. A continuous, uniform feed flow to the fluid bed is essential in order to maintain stable operations. The feed system originally installed on the MFB was a gravity feed system with an air assist to help overcome the back pressure created by the fluid bed. The system contained belt, vibrating, and rotary feeders which have been proven adequate in other material handling applications. This system, while usable, had several operational and feeding problems during the MFB testing. A major portion of these problems occurred because the coal and limestone feed control points - a belt feeder and rotary feeder, respectively - were pressurized in the air assist system. These control points were not designed for pressurized service. An alternate feed system which could accept feed from the two control points, split the feed into six equal parts and eliminate the problems of the pressurized system was sought. An alternate feed system designed and built by the Fuller Company was installed and tested at the Rivesville facility. Fuller feed systems were installed on the north and south side of C cell at the Rivesville facility. The systems were designed to handle 10,000 lb/hr of coal and limestone apiece. The systems were installed in late 1979 and evaluated from December 1979 to December 1980. During this time period, nearly 1000 h of operating time was accumulated on each system. Ceramic Heat Pipe Development. Semi-Annual Report, 1 October 1980-31 March 1981.
M. Merrigan. May 81, 23p
Contract W-7405-ENG-36

Progress is reported in the Ceramic Heat Pipe Development Program which is directed to the development of heat pipes for use in high-temperature heat exchangers. The development of ceramic heat pipe recuperator elements involves the selection and test of materials and fabrication techniques, subscale tests, design and test of components for full-scale recuperator applications, and demonstration of heat pipes in subscale and full-scale recuperator installations. Work on the program has involved the selection of candidate pipe envelope materials, working fluids, and protective liner materials based on temperature limits and compatibility considerations. Alumina-niobium-lithium and silicon carbide-tungsten-sodium combinations were selected for initial tests. The first successful operation of high temperature ceramic heat pipes was achieved using chemical vapor deposited (CVD) SiC as a container material and CVD tungsten as a protective liner. Controlled deposition of the tungsten was employed to give a textured surface for wicking. The working fluid used was sodium with the heat pipe closure accomplished by a tungsten-to-tungsten braze using a palladium-cobalt brazing alloy. These heat pipes were operated in air and in combustion gases at temperatures to about 1200 exp 0 K. Peak-measured heat transfer through a 2.0-cm-diam heat pipe was about 2 kW with operational limits estimated to be higher.After about 100 h of operation and 30 cold starts, one of these pipes was sectioned and the tungsten-SiC interface examined for evidence of deterioration or reaction. The reaction zone thickness was found to be in agreement with predictive models developed on the program. However, some evidence of liner shell bond deterioration was observed, prompting a continuing investigation of improved fabrication methods. (ERA citation 06:022418)

Budget Percentiles for Baseline and Redesigned All Commercial Building Types Assuming No Cooling.
Jul 79, 84p

Estimates are presented of the budget percentiles for baseline buildings as well as redesign buildings. Estimates are given for a large number of combinations of heating degree days (Base 60 exp 0) and cooling degree days (Base 50 exp 0), derived from the HDD (base 65 exp 0) and CDD (Base 65 exp 0) combination for 226 places as given in the Climate Atlas of the US. Places in the Climate Atlas arranged alphabetically are listed in Table A. Table B is entitled: Places Listed in the Climate Atlas Listed by the Same CDD (Base 50) Intervals as Budget Percentile Tables. Tabulated budget percentiles are given on: small and large offices; elementary and secondary schools; hospitals; clinics; gyms; community centers; nursing homes; hotels/motels; theaters; stores; shopping centers;storage; and apartment buildings. Performance Summary of the Balcomb Solar Home.
J. D. Balcomb, J. C. Hedstrom, and J. E. Perry, Jr. 1981, 6p CONF-810509-34
Contract W-7405-ENG-36
Annual conference of the International Solar Energy Society, Philadelphia, PA, USA, 26 May 1981.

The heating performance of the Balcomb passive solar home is re-evaluated based on detailed review of 85 channels of data taken during six weeks of 1980. This led to a re-analysis of 176 days of data taken over the winter of 1978-79. Auxiliary heat during this winter was 7.4 million Btu which compares with 66.0 million Btu total heat losses from the house plus 46.4 million Btu losses from the greenhouse. Auxiliary heat predicted using the solar load ratio method is 8.1 million Btu. Solar savings are estimated as 57 million Btu. Good thermal comfort conditions are documented. Energy flows are tabulated for each month. Energy flows are tabulated for each month. Conclusions regarding detailed heat flow and storage in the house are presented. (ERA citation 06:021862)

Magnetic Refrigeration for Spacecraft Systems.
J. A. Barclay. 1981, 9p CONF-810715-1
Contract W-7405-ENG-36
11. inter-society conference on environmental systems, San Francisco, CA, USA, 13 Jul 1981.

Magnetic refrigerators, i.e., those that use the magnetocaloric effect of a magnetic working material in a thermodynamic cycle, offer potentially reliable, and efficient refrigeration over a variety of temperature ranges and cooling powers. A descriptive analysis of magnetic refrigeration systems is performed with particular emphasis on more efficient infrared detector cooling. Three types of magnetic refrigerator designs are introduced to illustrate some of the possibilities. (ERA citation 06:022421)

Preliminary Market Potential Indexing Study of the United States for Direct Gain in New Single-Family Residential Construction.
W. M. Robson, and F. Roach. 1981, 6p CONF-810509-30
Contract W-7405-ENG-36
Annual conference of the International Solar Energy Society, Philadelphia, PA, USA, 26 May 1981.

The evaluation of the market potential for passive solar designs in residential new construction offers an attractive counterpart to the numerous market penetration assessments that have been performed over the last four years. Market penetration analyses have generally concerned themselves with the long run adoption of solar energy technologies, while Market Potential Indexing (MPI) addressed here examines the near-term attractiveness of solar. The MPI method is briefly reviewed, followed by specification of six attributes that may characterize the residential single-family new construction market. Raw attribute data for each of the six is presented for 220 regions within the United States. Attribute weighting functions are constructed from the perspective of consumers, producers or home builders, and the federal government. Preliminary results from these three perspectives are portrayed for a fixed sized direct gain design. (ERA citation 06:021746)

Ceramic Heat Exchangers: Manufacturing Techniques and Performance.
M. A. Merrigan, and D. J. Sandstrom. 1981, 16p
CONF-810377-1
Contract W-7405-ENG-36
WESTEC conference, Boulder, CO, USA, 23 Mar 1981.

The objective of the ceramic heat pipe program being conducted at Los Alamos is demonstration of the practical feasibility of this technology for the solution of severe high temperature recuperation functions. Ceramic heat pipe recuperators have been theoretically shown to offer distinct advantages over conventional ceramic heat exchangers from the standpoint of efficiency of heat recuperation and economics. The main stumbling block to their widespread utilization is related to the problems of materials for construction and the details of fabrication and assembly. The performance objectives of ceramic heat pipes and some aspects of the materials technology program aimed at solving the problem of economic ceramic heat pipe fabrication are described. Ventilation/Odor Study, Field Study. Final Report, Volume I.
R. A. Duffee, and P. Jann. Apr 81, 67p
Contract W-7405-ENG-48

The results are presented of field investigations in schools, hospitals, and an office building on the relation between ventilation rate and odor within the buildings. The primary objective of the study was to determine: the reduction in ventilation rates that could be achieved in public buildings without causing adverse effects on odor; the sources of odor in public buildings; and the identity of the odorants. The variables of particular interest include: type of odor, occupant density, odorant identity and concentration, differences in impressions between occupants adapted to prevailing conditions and visitors, and the influence of temperature and humidity on both the generation and perception of common contaminants. Sensory odor measurements, chemical measurements, fresh air ventilation measurements, and acceptability evaluations via questionnaires were made. Sensory odor levels were found to be quite low in most buildings tested. A three-to-five-fold reduction in the fresh air ventilation in schools, hospitals, and office buildings can be achieved without significantly affecting perceived odor intensities or detectability. Tobacco smoking was found to be the most significant, pervasive contributor to interior odor level. Total hydrocarbon content of indoor air varies directly with ventilation rates; odor, however, does not. The complete set of reduced data are contained in Volume II. (ERA citation 06:023714)

Solar Space Heating Installed at Kansas City, Kansas.
Final Report.
May 81, 135p NASA-CR-161763
Contract EG-77-A-01-4079

The solar energy system was constructed with the 48,800 square feet warehouse to heat the warehouse area of about 39,000 square feet while an auxiliary energy system heats the office area of about 9,800 square feet. The building is divided into 20 equal units, and each has its own solar system. The modular design permits the flexibility of combining multiple units to form offices or warehouses of various size floor areas as required by a tenant. Each unit has 20 collectors which are mounted in a single row. The collectors are double glazed flat plate collectors with a gross area of 7,800 sq ft. Air is heated either through the collectors or by the electric resistance duct coils. Extracts from the site files, specifications, drawings, installation, operation and maintenance instructions are presented.

Prepared in cooperation with Technical Univ. of Denmark, Lyngby.
Customers in the European Community Countries should apply to the office for official publications of the European Communities, B. P. 1003, Luxembourg.

A comparison of methods for predicting the performance of solar heating systems has been coordinated within the CEC Solar Energy R&D program. The methods which are developed within the EC countries are presented and compared in this report. The methods have been used to predict the performance of three different solar heating systems: a domestic hot water system, a pure house heating system and a combined system. Three different sets of weather data have been used: Carpentras, Hamburg and Ireland.

Guidelines for Installation of Solar Components on Low-Sloped Roofs--A Summary.
Final rept.,
W. J. Rossiter, Jr., and R. G. Mathey. Apr 81, 5p
Sponsored in part by Department of Energy, Washington, DC.
Pub. in Proceedings of the NBS/NRCA Conference on Roofing Technology (6th) held at Gaithersburg, MD., on April 30-May 1, 1981, p58-62 1981.

This paper presents guidelines for installation of solar collectors and related equipment on low-sloped roofs of commercial, industrial, and multi-family type buildings. The guidelines are concerned primarily with the waterproofing integrity of the roofing system, access to the collectors and roofing, attachment of different types of collector support frames and roofing field surveys, and information from the literature, building codes, roofing field surveys, and acceptable roofing practice provided the basis for the guidelines. The guidelines include recommendations for design of the solar installation with regard to roofing performance, workmanship during collector installation, and maintenance of roofs with solar components.

J. P. Kesselring, W. V. Krill, and R. J. Schreiber.
Feb 81, 163p FR-80-72/EE, GRI-80/0019
Contract GRI-5014-345-0283

The results of a review of the state of the art in infrared and catalytic burner development are presented. Four basic types of IR burners are currently is use. Eight commercial and/or residential appliances were characterized to assess the applicability of these burners. The refractory monolith tile and the fiber matrix burners appear most applicable for appliance use. Conceptual designs for the eight appliances with IR burners were prepared to evaluate the technical feasibility. These appliances are shown to have significant fuel efficiency increase and NOx and CO emission reduction benefits. Four appliances -- the commercial rangetop, deep fat fryer, commercial water heater, and warm air furnace -- also appear economically competitive, and recommended approaches for further development are presented. Lists of IR burner literature and patents are also included.

Cooling-and-Heating-Load Improvements in Seasonal-Performance Modeling of Room and Central Air Conditioners and Heat Pumps.
21 Mar 80, 104p
Contract AC03-79CS10757

The Seasonal Performance Model (SPM) has been developed to evaluate the seasonal cooling and heating performance of room air conditioners and central air conditioners and heat pumps. This model requires sizing the load to the product; the sizing is based on the Manual J procedure, with some minor modifications. The focus is on improving the product sizing technique of SPM by using a more realistic load estimate. A computer simulation program (SPMLD) was used to calculate the cooling and heating loads on an hourly basis. The results obtained indicate that a fairly good agreement exists between the hourly simulation (SPMLD) treatment and SPM treatment, when the following improvements are applied to the SPM model: a correction factor to the SPM infiltration rate for cooling load calculation, a correction factor to the SPM solar heat gain for cooling load calcula-

tion, shifting the zero load point from 65 exp 0 F to 60 exp 0 F outdoor temperature for heating load calculations. (ERA citation 06:022213)

Design of a Test Kit for Determining Polyelectrolyte Dosages Prior to Direct Filtration,
Robert C. Scholz, and Mark L. Holcomb. Mar 81, 66p
Contract DAAK70-79-C-0124

The purpose of this study was to develop a test kit which could be used for on-site prediction of the polymer dosage required for direct filtrtion of water sources such as streams and rivers. Criteria established for the test kit are that it be simple, rugged, fast, repeatable, and compact. An ideal test kit would be one that could predict effluent turbidity, run length, and potential failures, besides optimum polymer dosage. The first test kits tried represented very simple and quick methods: pouring dosed influent through granular or paer media filters. Side-by-side tests using these test kits and the Army pilot multi-media filter showed that these techniques would not be suitable. A small scale multi-media test kit called an interface monitoring test kit, was successfully developed that approached the ideal test kit requirements. This test kit, which monitors effluent turbidity through coal mdeium, as well as through all the media under steady state conditions, appears to be the most promising test ket method because: It uses the identical filtration mechanisms as the full-scale filter. It sensitively and accurately predicts optimum polymer dosage and closely approximates the effluent turbidity of the full scale filter. It is a renewable test kit, i.e., backwashing allows it to be repeatedly reused requiring only small quantities of polymer for each test. It can be constructed and repaired, if necessary, from off-the-shelf components. The process design for the test kit is included in this report. It is recommended that a prototype test kit be constructed and tested on a variety of natural water courses.

This three-volume study forecasts the universe of offshore installations (OSI) in waters proximate to U.S. territory out of the year 2005, and assesses the impact of the growth in numbers and types of these installations on the Coast Guard. Volume I describes the global, regional, national, and subnational forces operating to promote or inhibit the growth of the OSI universe; presents a forecast of the OSI universe resulting from the impact of these forces; describes the likely impact of this growth on the Coast Guard; suggests a set of alternative strategies that appear feasible and promising for the Coast Guard; and offers recommendations for the Coast Guard. Volume II presents detailed forecasts of a variety of categories of offshore installations related to energy, food, minerals, industrial expansion seaward, military and space, transportation, and science and technology. Volume III contains appendices for each of the key chapters of Volume II; the data and rationale supporting the forecasts of Volume II are presented. The conclusions of the study are summarized: By the year 2005 the population of oil and gas OSI will have expanded very significantly; OTEC installations will be a distant second; all other types of OSI will be a still farther distant third. The expansion of the OSI universe will increase the operating load on the Coast Guard enormously by the year 2005; there will be a strong need for decision to either expand Coast Guard capability or to reduce Coast Guard load.

Contract N00014-77-C-0567

This report discusses the technical feasibility of applying an internal Friction Damping - Nondestructive Evaluation technique for offshore structures. The theory of internal friction damping is presented as it has been historically applied to various materials. The report then discusses the method-

ology for the application of internal friction damping. The experimental apparatus and specific laboratory technique as applied to a 1/14 scale model offshore structure is next discussed in detail. The experimental test results are related to the feasibility of employing the test technique as a device for detecting incipient cracking in offshore structures. The report includes discussion of specific conclusions and recommendations for further investigation of in-service offshore structures. (Author)

User's Reference Manual: Computer Program for Design and Analysis of Inverted-T Retaining Walls and Floodwalls (TWDA).
Final rept.,
William A. Price, Robert L. Hall, H. Wayne Jones, Reed L. Mosher, and Michael E. George. Dec 80, 279p Rept no. WES-INSTRUCTION-K-80-7

Computer program TWDA (T-wall design/analysis) is a user-oriented conversationally interactive, modular time-sharing program system for computer-aided structural design of inverted-T retaining walls and floodwalls founded on earth or rock. Its essential characteristics include: (a) List-directed input with prompting available on request or as shown to be needed. Data lists may be entered interactively or in a data file. (b) Design for minimum cost including excavation, backfill, slab concrete, and stem concrete, with inputted unit costs. Default is to design for minimum concrete volume. (c) Multiple soils strata may be used as existing and/or backfill earth. Either Coulomb's equation or trail wedges may be used to get active earth pressures. (d) Multiple slopes may be used to model existing and/or finished grade surfaces. (e) Time-sharing printout is limited to the minimum needed by the user to make his design decisions. A full analysis report is available in an optional output file that may be listed on any terminal. (f) The program is structured to permit easy updating as criteria change. (g) Up to 10 load cases may be used. The user does not need to reenter any data by hand into subsequent runs. (h) The 1977 edition of ACI code 318 is used. Default procedures conform to the Corps of Engineers' Engineer Manuals in effect in 1980. The user may, however, direct the program to change many of the standard procedures as needed. (Author)

The Town Brook Feasibility study is of survey scope, undertaken for the purpose of recommending authorization or initiation of plans to solve water resource problems in the Town Brook watershed. The tasks of the study encompassed reviewing information from previous studies in the area and developing additional data and information to fill in the detail necessary to formulate a plan of improvement. The selection of the recommended plan was made after considering technical analyses and views of local interests and concerned agencies. (Author)

Evaluation of Planning for Fish and Wildlife at Corps of Engineers Reservoirs, Beltzville Reservoir Project, Pennsylvania.
Interim rept.
Apr 81, 101p
Contract DACW31-79-C-0005

Beltzville Dam is located in Carbon County, Pennsylvania, on Pohopoco Creek, approximately 8.4 km (5.2mi) above its confluence with the Lehigh River. The primary project purposes for the 383 ha (947 ac) lake are flood control and water supply. The FWS originally indicated that federal acquisition of an area roughly equivalent to the flooded area, and opening of these lands to public hunting, would recover all project-associated wildlife losses. Later, the FWS indicated that mitigation of damages at Beltzville would require the intense management of 121 ha (300 ac) of project land at a cost of $5,600 for initial development and $2,200 O&M annually for a period of five years, for a total five-year cost of $16,600. The FWS further recommended licensing the 121 ha (300 ac) of project lands to the PGC for wild-life management purposes. these actions were considered necessary to replace the project-related projected loss of 200 man-days of hunting. The desired project lands were licensed to the PGC for wildlife management; however, development and operation have been totally at state expense. The prime planning aid relating to fishery resources was prepared by the PFC and FWS in 1964. Total angler-use of the project was predicted to average 33,000 man-days which appears reasonably accurate.

Upgrading DA Trickling-Filter Sewage Treatment Plants.
Final rept.,
E. D. Smith, C. P. Poon, and R. D. Miller. May 81, 122p Rept no. CERL-TR-N-102

This report provides information, case histories, and design guidelines that will help Department of the Army (DA) personnel decide whether to use rotating biological contactors (RBCs) to upgrade their installations' trickling-filter sewage treatment plants. RBC technology is compared in terms of energy consumption, O&M requirements, efficiency, and reliability under various environmental and loading conditions. This report answers the questions most commonly asked about RBCs by DA personnel who must compare various upgrading alternatives. A stepwise approach has been provided to enable a more intelligent comparison of alternatives; this approach includes example calculations useful for estimating surface media, land, and energy requirements. Several independent studies were reviewed that have compared actual RBC performance data with the design claims of RBC manufacturers; discrepancies are pointed out and reasons offered for why the manufacturers' criteria should be accepted. Structural integrity problems (failure of media and/or shafts) have been documented for particular design vintage and certain proprietary RBCs. This report discusses these problems to ensure that DA personnel responsible for selection of pollution abatement technologies are aware of significant and provided to ensure that any selection of RBC technology by the Army is not plagued with medium/shaft failure incidents. Dawkins (William P.), Stillwater, OK.
User's Guide: Computer Program for Design or Investigation of Orthogonal Culverts (CORTCUL).
Final rept.,
William P. Dawkins. Mar 81, 196p WES-INSTRUCTION-k-81-7
Contract DACW39-80-M-0334

This user's guide describes a computer program called 'CORTCUL' that can be used for design or investigation of orthogonal, reinforced concrete culverts by either working stress design (WSD) or strength design (SD) procedures. In the design mode, the program determines the required thicknesses and reinforcement areas for given soil loadings and culvert opening sizes. In the investigation mode, material stresses or factors of safety are calculated for specified structural geometries and loadings. The program was developed from specifications furnished by the Corps of Engineers' Computer-Aided Structural Engineering (CASE) Task Group on Culverts and Conduits. The program follows as a minimum the procedures outlined in Engineer Manual 1110-2-2902, 'Conduits, Culverts and Pipes,' dated 3 March 1969. (Author)

Examination of Sample of Grout After 63 Years Exposure Underground.
Final rept.,
Jay E. Rhoderick. May 81, 13p Rept nos. WES/MP/SL-81-6, ONWI-248
Contract DE-AI97-81ET46633

During an investigation of the Troy Lock and Dam, New York, a core was recovered that contained part of a metal anchor that had been grouted into foundation rock. Since this grout was about 63 years old and had presumably been continuously below the water table, it provided an opportunity to study the effect of this environment for this period of time on the phase composition and microstructure of this grout. The phase composition of the grout was studied by X-ray diffraction; its microstructure was studied by scanning electron microscopy. It was found that the grout had a normal composition and microstructure; the environmental conditions had not had a significant effect on either composition or microstructure. The original water content had been fairly high as would be expected. (Author)

Evaluation of Lands for Recreational Snowmobile Use (Guidelines for Natural Resources Management and Land Use Compatibility).
Final rept.,
Robert M. Lacey, R. S. Baran, W. D. Severinghaus, and D. J. Hunt. May 81, 80p Rept no. CERL-TR-N-105

This report describes a recommended method to evaluate land areas on Army installations for use by recreational snowmobiles. Personnel normally charged with land management responsibilities can perform this evaluation. The method includes recommended procedures to identify incompatible land uses, establish noise buffer zones, evaluate biological and terrain suitability, choose candidate areas or corridors, and establish trails. Factors considered in the evaluation method include user participation, existing trail systems, user demand, trial signing, vehicle operating conditions, and environmental assessment and monitoring. National Dam Safety Program. Parker Street Dam. (NJ00055), Atlantic Coastal Basin. North Branch of Forked River, Ocean County, New Jersey. Phase I Inspection Report.
Final rept.,
John P. Talerico. May 81, 72p DAEN/NAP-53842/NJ00055-81/05
Contract DACW61-79-C-0011
Prepared in cooperation with Harris-ECI Associates, Woodbridge, NJ.

Parker Street Dam is an earthfill dam with a paved roadway along the crest. The original embankment has been filled in on the downstream side to form a parking area for those swimming at the lake. There is a timber box spillway located approximately in the center of the dam. The overall condition of the dam is good. There are no signs of distress or instability in the dam. The hazard potential is rated as 'high'. Parker Street Dam is considered inadequate in view of its lack of spillway capacity to pass the SDF (1/2 PMF) without overtopping the dam. The spillway is capable of passing a flood equal to 8 percent of the PMF (16 percent of the 1/2 PMF), and is assessed as 'inadequate'. At present, the engineering data available is not sufficient to make a definitive statement on the stability of the dam, but based on the findings of the visual inspection, the preliminary assessment of static stability is that it is satisfactory. Actions are recommended along with a timetable for their completion.

National Dam Safety Program. Lake Grinnel Dam (NJ00289). Wallkill River Basin, Tributary to Wallkill River. Sussex County, New Jersey. Phase I Inspection Report.
Final rept.,
Richard J. McDermott, and John E. Gribbin. Jul 81, 77p DAEN/NAP-53842/NJ00289-81/07
Contract DACW61-79-C-0011
Prepared in cooperation with Storch Engineers, Florham, NJ.

Based on available records, past operational performance, visual inspection and Phase I engineering analysis, Lake Grinnel Dam is assessed as being in fair overall condition. Based on investigations of the downstream flood plain made in connection with this report, it is recommended that the hazard potential classification be downgraded from high to significant hazard. Hydraulic and hydrologic analyses indicate that the spillways are inadequate. Discharge capacity of the spillways is not sufficient to pass the designated spillway design flood (100-year storm) without an overtopping of the dam. The spillways are capable of passing approximately 1 percent of the SDF. Therefore, the owner should engage a professional engineer experienced in the design and construction of dams in the near future to perform more accurate hydraulic and hydrologic analyses relating to spillway capacity. Based on the findings of the analyses, the need for and type of remedial measures should be determined and then implemented. The owner should, in the near future, develop an emergency action plan together with an effective warning system outlining actions to be taken by the operator to minimize downstream effects of an emergency at the dam.

Contract DACW61-79-C-0011
Prepared in cooperation with Storch Engineers, Florham, NJ.

Based on available records, past operational performance, visual inspections and Phase I engineering analysis, Cooks Pond Dam is assessed as being in fair overall condition. Based on investigations of the downstream flood plain made in connection with this report, it is recommended that the hazard potential classification be downgraded from high to significant hazard. The spillway is capable of passing the designated spillway design flood (100-year storm) without an overtopping of the dam and, therefore, is assessed as being adequate. It is recommended that the following remedial measures be undertaken by the owner in the future: (1) The spillway discharge chamber and discharge channel should be cleaned of debris. (2) Soil on the downstream side of the embankment should be properly graded, compacted and stabilized. (3) Trees and adverse vegetation on the embankment should be removed. (4) Deteriorated stoplogs should be replaced. (5) Riprap on the upstream side of dam should be renovated. (6) The crest of dam should be properly stabilized.

National Dam Safety Program. Kemah Lake Dam (NJ00268). Delaware River Basin . Tributary to Paulins Kill, Sussex County, New Jersey. Phase I Inspection Report.
Final rept.,
Richard J. McDermott, and John E. Gribbin. Jun 81, 97p DAEN/NAP-53842/NJ00268-81-06
Contract DACW61-79-C-0011
Prepared in cooperation with Storch Engineers, Florham Park, NJ.

Hydraulic and hydrologic analyses indicate that the spillway is seriously inadequate. Discharge capacity of the spillway is not sufficient to pass the designated spillway design flood (SDF) without an overtopping of the dam, and dam failure would significantly increase the hazard downstream over that which would exist without dam failure. (The SDF for Kemah Lake Dam is equal to one-half the probable maximum flood.) The spillway is capable of passing approximately 11 percent of the probable maximum flood or 22 percent of the SDF. Therefore, the owner should engage a professional engineer experienced in the design and construction of dams in the near future to perform more accurate hydraulic and hydrologic analyses relating to spillway capacity. Based on the findings of the analyses, the need for and type of remedial measures should be determined and then implemented. The owner should, soon, develop an emergency action plan together with an effective warning system outlining actions to be taken by the operator to minimize downstream effects of an emergency at the dam.

Richard J. McDermott, and John E. Gribbin. May 81, 96p DAEN/NAP-53842/NJ00785-81-05
Contract DACW61-79-C-0011
Prepared in cooperation with Storch Engineers, Florham, NJ.

Based on investigations of the downstream flood plain made in connection with this report, it is recommended that the hazard potential classification be downgraded from high to significant hazard. Hydraulic and hydrologic analyses indicate that the spillway is inadequate. Discharge from the spillway is not sufficient to pass the designated spillway design floor (100-year storm) without an overtopping of the dam. The spillway is capable of passing approximately 56 percent of the SDF. Therefore, the owner should engage a professional engineer experienced in the design and construction of dams in the near future to perform more accurate hydraulic and hydrologic analyses relating to the spillway capacity. Based on the findings of the analyses, the need for and type of remedial measures should be determined and then implemented. The owner should, in the near future, develop an emergency action plan together with an effective warning system outlining actions to be taken by the operator to minimize downstream effect of an emergency at the dam.

National Dam Inspection Program. Blue Giant Meadow Dam. (NDI ID Number-PA-00564 DER ID Number-40-80 Susuehanna River Basin, Tributary to Little Wapwallopen Creek, Luzerne County, Pennsylvania. Phase I Inspection Report.
Apr 81, 66p
Original contains color plates: All DTIC and NTIS reproductions will be in black and white.

The visual inspection and review of available design and construction information indicate that Blue Giant Meadow Dam is in poor condition. Deficiencies noted during the inspection included the poor condition of the spillway, eroded portions of the embankment crest, lack of any operable draw-

down facility, and heavy growth of trees and brush on the embankment. In accordance with the recommended guidelines the spillway design flood for this facility is in the range of the 100 year flood to 1/2 the PMF. Based on the size of the dam the selected SDF is the 100 year flood. The hydrologic and hydraulic computations indicate that the combination of reservoir storage and spillway discharge capacity cannot pass the Spillway Design Flood (100 year flood) without overtopping the dam. Therefore, in accordance with criteria outlined and evaluated in Section 5.5 of this report, the spillway for Blue Giant Meadow Dam is considered to be inadequate.

Description of Emission Control Using Fluidized-Bed, Heat-Exchange Technology.
G. J. Vogel, and P. J. Grogan. Jun 80, 97p
Contract W-31-109-ENG-38

Environmental effects of fluidized-bed, waste-heat recovery technology are identified. The report focuses on a particular configuration of fluidized-bed, heat-exchange technology for a hypothetical industrial application. The application is a lead smelter where a fluidized-bed, waste-heat boiler (FBWHB) is used to control environmental pollutants and to produce steam for process use. Basic thermodynamic and kinetic information for the major sulfur dioxide (SO sub 2) and NO/sub x/ removal processes is presented and their application to fluidized-bed, waste heat recovery technology is discussed. Particulate control in fluidized-bed heat exchangers is also discussed. (ERA citation 06:023765)

Coal-Based Industrial-Fuels Assessment.
R. S. Bennett, H. J. Takach, W. H. Seward, R. S. Opalanko, and K. E. Wilzbach. 1980, 16p
Contract W-31-109-ENG-38
Air Pollution Control Association annual meeting, Montreal, Canada, Jun 1980.

This paper presents the results of a study to identify the economic, environmental, and energy impacts of possible New Source Performance Standards for industrial steam generators on potential use of coal and coal-derived fuels in such steam generators. In addition, the same impacts for distillate and residual fuel oils were identified for comparative purposes. This assessment will allow for substantive input to assist DOE in responding to the NSPS that will be proposed by EPA. This program utilized a systems-level approach where the industrial boiler and its fuel supply were considered from the standpoint of a potential industrial user. The system was composed of that combination of plants, facilities, and units that could take a clean, run-of-mine coal or refined fuel oil and produce a given quantity of heat input to a boiler, generating steam at a given pressure and temperature, while simultaneously generating steam at a given pressure and temperature, while simultaneously complying with the environmental standards selected for study. The most attractive applications of coal technology, based on the cost of steam produced, for industrial steam generators depends on boiler size, annual operating factor, and level of air emission controls applied. Under the Level-1 control scenario, direct combustion of low-sulfur coal is the most economical application of coal. Direct combustion of high-sulfur coal with wet flue-gas desulfurization is the least economical application under the same level of control for the technologies studied. About a dozen other specific conclusions are described briefly. (ERA citation 06:023413)

In-situ coal gasification is a new technology currently under development by the United States Department of Energy (DOE). The Pricetown I field test is part of this continuing effort and was performed by DOE's Morgantown Energy Technology Center with Mound Facility providing the major instrumental and field crew support. The use of eastern bituminous coal resources with high sulfur content could be limited because of environmental regulations. Consequently an examination of the impact of sulfur containing and other possible gaseous components from the in-situ gasification on air quality is desirable from both a environmental and economical viewpoint. Using fast response analytical systems and real-time data acquisition a high density data base was acquired for 17 gaseous components of the product gas stream, including SO sub 2 , H sub 2 S, COS, and HCN. The data show that almost all gaseous sulfur from the bituminous coal was emitted as H sub 2 S. The SO sub 2 and COS values rarely exceeded the background of the instruments although the COS values did rise to about 100 ppM during the gasification phase. Except for one short period when values rose to 60 ppM, the HCN similarly stayed at the instrument background level of about 1 ppM. Because proven technology to clean H sub 2 S from gas streams is available, the Pricetown test indicates that in-situ gasification of high sulfur bituminous coal on a commercial scale should not contribute to deterioration in air quality. (ERA citation 06:023055)

The very dense Summer Chemistry of Rain Experiment (SCORE) network of samplers was used to analyze the spatial variablity of sulfate concentration and pH in convective precipitation. All available data from each site for the 1979 field experiment were included in the analysis. The sulfate values varied between 0.5 and 15 mg/L or by more than a factor of 30. The range of median values for the data set was 1.7 to 4.7 mg/L or a factor of 2.8. The range of pH values was 3.3 to 7.4 for all data, but for heavier rainfalls the range was 3.4 to 7.1. The median pH for all data was about 4.3. Fourteen pairs of aerosol samples were obtained to examine the reproducibility of sample collection and analysis. Good agreement was found for Si, S, K, Ca, Fe, and TSP and poorer agreement for Ti, Mn, Zn, Br, and Pb. However, statistical analyses reveals that the agreement is clearly less than desired. Some possible explanations for the discrepancies are offered, but additional experiments are needed to clarify this problem for addressing spatial variability problems. A comparison was carried out between an inverted funnel aerosol collection method and an isokinetic sampler free to move with the wind. The data shows that the isokinetic sampler collects more aerosol for the 11 elements analyzed and TSP than the inverted funnel. Statistical methods to estimate background lithium tracer experiments were used to help predict the deposition patterns. The evaluation of a newly designed sequential sampler for precipitation chemistry was carried out in a field experiment. (ERA citation 06:024123)

Contract W-7405-ENG-48
International symposium on health impacts of different sources of energy, Nashville, TN, USA, 22 Jun 1981.
Microfiche only after original copies are exhausted.

The risk of occurrence of significant unfavorable environmental, health, and safety impacts associated with tar-sand technologies have been estimated. These estimates were made from information related to typical emerging surface (above ground) and in situ (underground) tar-sand oil-recovery processes. Both types of processes are being developed for use on tar-sand deposits in the US and may also be applicable to deposits in other countries. The levels of pollutant emissions affecting land, air, and water were determined from data related to current US field experiments involving surface processes (including retort and solvent extraction methods), and in situ techniques (including combustion and steam-injection methods). Next, these data were extrapolated to determine pollutant levels expected from conceptual commercial facilities producing 20,000 bbl/d. These estimates predict the nature and magnitude of environmental, health, and safety impacts. The likelihood-of-occurrence of these impacts was then assessed. Experience from other industries, including information concerning health and ecosystem damage from air pollutants, measurements of ground-water transport of organic pollutants, and the effectiveness of environmental-control-technologies, was used to make this assessment. It was concluded from this assessment that certain adverse effects are more likely to occur than others. These effects can be ordered for surface and in situ technologies according to their likelihood-of-occurrence. Occupational health problems including those related to worker exposure to carcinogenic and other hazardous substances are likely to occur during surface extraction. Public health and ecosystem effects may occur from both technologies but will be localized and/or controllable. (ERA citation 06:023155)

DOE hot gas cleanup contractor's meeting, Morgantown, WV, USA, 3 Feb 1981.
Microfiche only after original copies are exhausted.

The Morgantown Energy Technology Center (METC) is involved in the development of processes and equipment for the production of low-Btu gas from coal and for the fluidized bed combustion of coal. The ultimate objective is the large scale production of electricity using high temperature gas turbines. Such turbines, however, are susceptible to drastically accelerated corrosion and self-destruction when relatively low concentrations of sodium and potassium are present in the driving gas streams. Knowledge and control of the con-

centrations of those elements, at part per billion levels, are critical to the success of both the gas cleanup procedures that are being investigated and the overall energy conversion processes. This report describes instrumentation and procedures developed for application to the problems outlined above and results that have been obtained. The Ames instruments, which feature an automated, dual channel flame atomic emission spectrometer, perform the sodium and potassium determinations simultaneously repetitively, and automatically every two to three minutes by atomizing and exciting a fraction of the subject gas sample stream in either an oxyhydrogen flame or a nitrous oxide-acetylene flame. The analytical results are printed and can be transmitted simultaneously to a process control center. Work on the development of instruments for sequential and simultaneous on-line determination of many other elements that may impact the economics, process chemistry, and/or environmental acceptability of proposed coal conversion/gas cleanup processes will also be outlined. The latter instruments are based on inductively coupled plasma excitation of the sample streams. (ERA citation 06:023032)

Coal-Fired Power Plant (Eastern Coal): Environmental Characterization Information Report.
Jan 81, 69p DOE/EP-0013
Contract AT03-76EV74010
Microfiche only after original copies are exhausted.

This Environmental Characterization Information Report (ECIR) for Coal-Fired Power Plants (Eastern Coal) has been prepared from the latest available environmental and technical information collected from a number of sources. The typical plant chosen for characterization is a 500-MWe nameplate rating pulverized-coal plant with an electrostatic precipitator, wet scrubber, and a wet-mechanical-draft cooling tower. It is a mine-mouth facility, with its own coal preparation plant. The process, plant operating parameters, resources needed, and the environmental residuals and products associated with the power plant are presented. Annual resource usage and pollutant discharges are shown in English and metric units, assuming an annual plant capacity factor of 80%. While this capacity factor is representative of the reliability of generating units of this size, it does not consider unscheduled shutdowns for repairs of the plant and associated environmental control equipment or factors independent of the plant itself, e.g., reserve requirements. Acid Rain Information Book. Final Report.
May 81, 235p DOE/EP-0018
Contract AC01-79EV10273
Microfiche only after original copies are exhausted.

Acid rain is one of the most widely publicized environmental issues of the day. The potential consequences of increasingly widespread acid rain demand that this phenomenon be carefully evaluated. Review of the literature shows a rapidly growing body of knowledge, but also reveals major gaps in understanding that need to be narrowed. This document discusses major aspects of the acid rain phenomenon, points out areas of uncertainty, and summarizes current and projected research by responsible government agencies and other concerned organizations. Evaluation of Mixing Systems for Biogasification of Municipal Solid Waste.
J. T. Swartzbaugh, and R. B. Smith. 79p
Contract AC05-76CS20100

Two specially selected mixing systems were tested and evaluated to determine how effectively they could prevent the formation of fibrous mats and stringers during the anaerobic digestion of a slurried mixture of preprocessed municipal slide waste and sewage sludge to produce methane gas. The tests were conducted in a modified 10.7 m (35 ft) diameter, nominal 378,000 liter (100,000 gal) capacity concrete vessel in the Franklin, Ohio, environmental complex. This complex included two plants that collectively provided the solid waste/sewage sludge feedstock. One of the two mixing systems was a mechanical agitator--a vessel-centered rotary shaft with four blades at each of two levels to drive the slurry downward. The second system included three equidistantly placed gas gun assemblies that each produced bubbles at a constant rate to draw the slurry upward. The solids accumulations were generally the same for the two mixing systems when they had common test conditions. In all tests, the percent solids for the top level were higher than those for the middle and bottom levels. As the feed ratio and the percent solids in the feedstock were increased, this differential became progressively more pronounced. Moreover, the percent of volatile solids (in a given amount of total solids) for the top level became disproportionately higher than those for the other two levels. (ERA citation 06:022256)

Determination of Valuable Metals in Liquefaction-Process Residues, Report No. 45. Quarterly Technical Progress Report, January 1, 1979-March 31, 1979.
R. R. Ruch, S. J. Russell, R. Malhotra, R. A. Cahill, and J. K. Frost. 19 Apr 79, 14p
Contract AC21-76MC08004

Included in the list of US imports in 1974 are metals for which a substantial quantity of reserves within the US have been identified; however, in most cases extraction of these metals would involve higher costs than imported prices. The 33 elements for which over 25% of the total US need was met through imports in 1974 include: Pd, Hf, Pt, Ni, Sb, I, Hg, Th, Al, F, Sr, Tl, Cr, Sn, Bi, W, Co, Ta, Ag, In, Mn, Cd, Zn, Te, Ge, Ti, Au, Se, Ba, Sc, As, Fe, and V. A comparison of this list with elements found in the coal liquefaction residue shows that with the exception of I, Hg, F, Te, and Se, all the 28 other elements are present in the coal liquefaction residues in varying concentrations. Their economic significance will depend not only upon the demand-supply factors but also upon the feasibility of their recovery, both technical and economical. To further determine metals of economic value, the second criteria used is the projected growth in demand. An examination of the US Bureau of Mines Projections shows that there are 30 elements for which the demand by the year 2000 would more than double. The demand for two elements - thorium and cesium - is projected to increase by more than 1000% by the year 2000. In addition there are four elements for which the demand is projected to increase more than 200% between 1974 and 2000. These include uranium, hydrogen, beryllium and gallium. The other elements for which demand is projected to increase by more than 100% inluded: V, Au, O, Cl, Se, Al, B, Li, W, Zr, Br, F, Mg, Mo, Sb, Hf, Ti, I, Ta, N, Cu, S, Zn and Cd. With the demand for these elements projected to increase dramatically over the next two decades, procurement of some of these elements could become difficult. All but Cl, Se, Br, F, I, N, and S are present in varying concentrations in the liquefaction residues. (ERA citation 06:021538)

Rivesville Multicell Fluidized-Bed Boiler. Annual Technical Progress Report, July 1979-June 1980.
1980, 133p
Contract AC21-81MC16230

Design, construction and test program of a 300,000 lb/hr steam generating capacity multicell fluidized bed bouler (MFB), as a pollution free method of burning high-sulfur or highly corrosive coals, is being carried out. The concept involves burning fuels such as coal, in a fluidized bed of limestone particles that react with the sulfur compounds formed during combustion to reduce air pollution. Nitrogen oxide emissions are also reduced at the lower combustion temperatures. The CaSO sub 4 produced in the furnace is discharged with the ash or regenerated to CaO for reuse in the fluidized bed. This report presents information on continued operation of the Rivesville MFB steam generating plant in a commercial mode and for determining performance and emission characteristics; studies and tests on flyash characterization and reinjection, fuel feed educators and needles, air distributor, corrosion-erosion and sulfur capture; engineering studies to improve MFB performance and reliability. Comparison of Alternative Approaches for Estimation of Particulate Concentrations Resulting from Coal Strip Mining Activities in Northeastern Wyoming.
Oct 79, 119p
Contract AC01-76PR50171

This study was undertaken for the Department of Energy (DOE) to compare several alternative approaches to the estimation of particulate concentrations resulting from strip mining. The four alternative approaches for quantifying particulate emissions are: the exclusion of fugitive dust emissions; the consideration of only the respirable particulates emitted by mining activities; the consideration of only the inhalable particulates emitted by mining activities; the inclusion of all sources of particulates within the mining cycle by which soil and coal are removed, stored, or transported. For assessment purposes, these four alternatives were applied to the expected level of mining activity (existing and proposed) in the Anderson-Wyodak coal field in 1985. Regional air quality modeling analyses were performed using the most recently developed emission factors and a simple particle deposition scheme. Based on the results of the modeling analyses, relative costs, production constraints, and uncertainties associated with each emission alternative were determined. In general, the conclusions of this study are as follows: potential air quality impacts which may result from the operations of a surface coal mine are, to a large degree, dependent on the analytical approaches selected; there are substantial uncertainties associated with the methods and techniques used to analyze fugitive dust sources; and even using the most up-to-date techniques, two of the alternative approaches predicted concentrations which may exceed federal and state ambient air quality standards, which in turn may constrain future coal production in this region or others with high density mining operations. Emissions Inventory for the SURE Region. Final Report.
H. A. Klemm, and R. J. Brennan. Apr 81, 293p

One purpose of the Sulfate Regional Experiment (SURE) program is to define the mechanisms that link emissions to ambient concentrations of sulfur dioxide and sulfates and subsequently develop a useful air quality model that relates emissions to ambient concentrations. Described in this report is the phase of the SURE program involved with the development of a detailed emissions inventory. Inventories were prepared for all man-made stationary sources of emissions and surface transportation emissions. Variations in emissions by season, from weekday to weekend, and for eight 3-hour periods throughout the day were reported. Estimates of emissions of sulfur dioxide, sulfate,particulate matter, nitrogen monoxide, nitrogen dioxide, and three classes of hydrocarbons were prepared. Inventories of sulfur dioxide and sulfate emissions from electric utility sources in the region were prepared for August and October 1977, January 10 to February 9, 1978, April 3 to May 2, 1978, and July 1978. Hourly variations on a point-by-point basis were reported. Relationships between emission rates and external factors that influence those rates were investigated for different source types. Finally, a detailed analysis of the accuracy of the emissions was performed. A unique feature of this inventory was the acquisition of hourly SO sub 2 emission rates from electric power plants during those months when the SURE intensive measurements were conducted. This detailed data base, along with the longer term emissions estimates, showed that total SO sub 2 emissions over the SURE region varied by no more than 15%. It was found that fossil-fueled power plants emit between 50 and 60% of the SO sub 2 , depending on

the season, and approximately 30% of the NO. Approximately 80% of the pollutants emitted from power plants are confined within the lower 300m (1000 ft.) of the atmosphere, i.e., the bulk of these pollutants is confined within the mixed layer. (ERA citation 06:022545)

Leaching Experiments on Coal Preparation Wastes: Comparisons of the EPA Extraction Procedure with Other Methods.
R. C. Heaton, P. L. Wanek, E. F. Thode, E. J. Cokal, and P. Wagner. Apr 81, 25p
Contract W-7405-ENG-36

Mineral wastes from seven coal preparation plants, located in the Illinois Basin, the Appalachian Region, and the West have been leached in accordance with the EPA extraction procedure published in the Federal Register dated May 19, 1980. This is one of the tests required for the classification of solid wastes under RCRA. When examined according to the procedures set forth in the Federal Register, all of the coal waste leachates had trace element concentrations below the the maximum set by EPA. Results of the EPA leaching procedure compare favorably with those of our own leaching experiments for those elements which were analyzed (Ag, As, Ba, Cd, Cr, Hg, Pb, Se). However, we note that coal wastes release substantial quantities of other trace elements not included in the protocols at the present time (Fe, Al, Ni, Mn, Zn, Cu). In addition, the requirement that the test leachage be maintained at pH less than or equal to 5 has the effect of establishing an abnormal environment for those wastes that are neutral or alkaline. Influence of Fuel Sulfur on the Selective Reduction of NO by NH sub 3.
D. Lucas, and N. J. Brown. Jan 81, 8p CONF-810704-2
Contract W-7405-ENG-48
International specialists meeting of the Combustion Institute, Bordequx, France, 20 Jul 1981.

More intensive regulations of the emissions of nitrogen oxides from stationary combustion sources have prompted the innovation and characterization of new control technologies suitable for applications in utilities. One of the more recent and attractive abatement technologies is the Thermal DeNO/sub x/ process which has been described by Lyon and Longwell. This process removes NO by selectively reducing it with NH sub 3 added to the post-combustion gases containing excess oxygen. This process is thus independent of the NO formation mechanism and makes no distinction between thermal and fuel NO. The present study is concerned with characterizing the selective reduction process for light distillate oil fuel admixed with variable amounts of pyridene and thiophene in a laboratory scale combustion tunnel under a variety of experimental conditions. This paper reports on those aspects of the study concerned with the investigation of possible synergistic effects between the sulfur and selective reduction chemistry. (ERA citation 06:021596)

Supersedes PAT-APPL-901 047-78.
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 $0.50.

Improved separation of heavier material from a dispersoid of gas and heavier material entrained therein is taught by the method of this invention which advantageously uses apparatus embodied in an inertial separator having rotary partition means comprising wall members dividing a housing into a plurality of axially-extending through passages arranged in parallel. Simultaneously with the helical transit of a moving stream of the dispersoid through the parallel arrangement of axially-extending through passages at a constant angular velocity, the heavier material is driven radially to the collecting surfaces of the rotational wall members where it is collected while the wall members are rotating at the same angular velocity as the moving stream. The plurality of wall members not only provides an increased area of collecting surfaces but the positioning of each of the wall members according to the teaching of this invention also results in a shortened time-of-flight to the collecting surfaces. National Transportation Safety Board, Washington, DC. Office of Evaluations and Safety Objectives.
Safety Effectiveness Evaluation--The Improvement of Nighttime Conspicuity of Railroad Trains.
Safety rept.
3 Apr 81, 49p NTSB-SEE-81-3
Color illustrations reproduced in black and white.

The National Transportation Safety Board examined nighttime accidents in which highway vehicles strike trains that block grade crossings. There is adequate evidence to suggest that this type of accident is strongly influenced by motorists' inability to perceive the presence of trains in crossings because trains lack conspicuity within their environment. This type of accident results each year in approximately 1,800 collisions with 140 persons killed and 800 injured. The Safety Board reviewed pertinent research undertaken by the Federal Railroad Administration (FRA) on a known countermeasure--reflectorization. The Safety Board issued recommendations to the FRA to develop and issue an advance notice of proposed rulemaking within 6 months for the improvement of nighttime train car and locomotive visibility at grade crossings to aid in preventing accidents in which motor vehicles run into the sides of trains at night. Additionally, the Board recommended that the FRA cooperate with the Federal Highway Administration, the National Committee on Uniform Traffic Control Devices, and the Association of American Railroads to plan and institute a research program on criteria for the use of reflectorization devices and materials.

Industrial Process Fugitive Emissions Inventory for the Region V Great Lakes Shoreline.
Final rept.,
Charles Mackus, and Eddy Lin. 1980, 261p
Contract EPA-68-01-4140

This report was the result of a limited-scope preliminary study of particulate fugitive emissions from major industrial sources located within the six states of U.S. EPA Region V. This study revealed that approximately 229,000 to 531,000 tons of fugitive particulates were deposited into the Great Lakes during 1978. Large industrial cities such as Chicago, Gary, Cleveland, Toledo, Detroit, and Milwaukee were found to have the largest concentration of major fugitive emission sources. Iron and steel industries were found to be the largest fugitive emission sources bordering the lakes.

Evaluation of the Rochester, New York Community Transit Service Demonstration-Volume II: Evaluation Report.
Final rept. Nov 77-Mar 80,
Debra A. Newman, and Michael Holoszyc. Oct 80, 178p SYSTAN-D161-7, UMTA-NY-06-0048-81-2
Contract DOT-TSC-1416

The primary purpose of the Rochester Community Transit Demonstration was to test a strategy for providing cost-effective demand-responsive transit service in suburban areas. Services were planned to have sufficiently low operating costs so that the communities could afford to continue these services after the demonstration. Cost-effectiveness was sought by encouraging close community involvement, using small vehicles, and inviting competitive bidding for new paratransit service operations. The demonstration project was an outgrowth of the Rochester Integrated Transit Demonstration, which took place between April 1975 and October 1977. In the new demonstration, both public and private operators provided Dial-A-Ride and handicapped services, and their performances were compared. The demonstration also included a unique funding strategy that shifted responsibility to the local towns served by Dial-A-Ride vehicles. This report evaluates the results of the demonstration, which includes the implementation process, the level of service provided to users, the demand response, and the services' operating efficiency. The implications of the Rochester experience are summarized for the benefit of other localities interested in implementing similar services. An epilogue section, documenting activities that have occurred since the demonstration ended is also included.

Chlorine Dioxide for Wastewater Disinfection: A Feasibility Evaluation.
Final rept. Sep 77-Jun 80,
Paul V. Roberts, E. Marco Aieta, James D. Berg, and Bruce M. Chow. Jun 81, 159p EPA-600/2-81-092
Grant EPA-R-805426

Chlorine dioxide was compared with chlorine for the disinfection of wastewater in laboratory experiments. Disinfection with chlorine dioxide was also demonstrated at a full-scale wastewater treatment plant. Criteria for comparison included coliform kill, inactivation of poliovirus and other indicators, and formation of halogenated organic by-products. In general, chlorine dioxide accomplished a given fractional kill of total coliforms with a smaller product (residual x time) than chlorine. The required mass doses of the disinfectants were approximately equal for treating conventional activated-sludge effluent. The required dose of chlorine was approximately 2 to 10 times greater than that of chlorine dioxide for treating filtered, nitrified effluent, depending on the coliform standard. Chlorine dioxide was found to be more effective for inactivating Polio-virus I and natural populations of coliphage in both non-nitrified and filtered, nitrified wastewater effluents. Chlorine dioxide treatment formed no measurable amounts of trihalomethane by-products, whereas chlorine treatment formed 0.5 to 5 micro Mol per liter of trihalomethanes, chiefly chloroform, in experiments using wastewater effluents. Based on a total coliform standard of 1000 per 100 ml disinfection with chlorine is estimated to cost 0.3 to 1.7 cents per cu m (1.1 to 6.4 cents per 1000 gallons), depending on plant size, compared with 1.5 to 3.5 cents per cu m (5.8 to 13.4 cents per 1000 gallons) for disinfection with chlorine dioxide (1979 price levels).

Field Tests and New Design Procedure for Laterally Loaded Drilled Shafts in Clay.
Final rept. Sep 76-Aug 80,
Mark W. Bierschwale, Harry M. Coyle, and Richard E. Bartoskewitz. Jan 81, 131p TTI-2-5-77-211-3F, FHWA/TX-81/09-211-3F
Sponsored in part by Texas State Dept. of Highways and Public Transportation, Austin. Transportation Planning Div.

Lateral load tests were conducted on three drilled shafts in predominantly CH soil. Shaft sizes varied from 30 in. (760 mm) to 36 in. (910 mm) in diameter and 15 ft. (4.6 m) to 20 ft. (6.1 m) in length. Loads were applied incrementally at a point 2.6 ft. (790 mm) above the ground surface. Duration of the tests was 57, 24 and 205 days. Measurements of lateral earth pressure at various points along the length of the shaft, displacement near the ground surface, and rotation in the plane of loading were obtained for each increment of load. Additional data on five shafts tested under similar conditions were obtained from the literature. Based upon an analysis of the test data, the ultimate lateral load capacity of a rigid shaft was defined as the load required to produce a shaft rotation of 2 degrees. This definition was used to obtain an empirical correlation of rotation with lateral load. A correlation of the coefficient of ultimate resistance at the groundline, Np, with soil shear strength was also made. A design procedure utilizing the two correlations was developed. Several analytical methods described in the literature were used to calculate the capacity of the eight test shafts. The results were compared with computed capacities obtained by use of the design procedure developed for this research study.

Airborne Radiological Sampling of Mount St. Helens Plumes,
Vernon E. Andrews. Apr 81, 20p ORP-LVF-81-2

Particulate and gaseous samples for radiologial analyses were collected from the plumes created by eruptions of Mount St. Helens. The sampling aircraft and equipment used are routinely employed in aerial radiological surveillance at the Nevada Test Site by the Environmental Protection Agency's Environmental Monitoring Systems Laboratory in Las Vegas, Nevada. An initial sample set was collected on April 4, 1980, during the period of recurring minor eruptions. Samples were collected again on May 19 and 20 following the major eruption of May 18. The Environmental Protection Agency's Office of Radiation Programs analyzed the samples for uranium and thorium isotopes, radium-226, lead-210, polonium-210, and radon-222. Other laboratories analyzed samples to determine particle size distribution and elemental composition. The only samples containing radioactivity above normal ambient levels were collected on May 20. Polonium-210 concentrations in the plume, determined from a sample collected between 5 and 30 km from the crater, were approximately an order of magnitude above background. Radon-222 concentrations in samples collected from the plume centerline at a distance of 15 km averaged approximately four times the average surface concentrations. The small increases in radioactivity would cause no observable adverse health effects.

Miljoestyrelsen, Copenhagen (Denmark).
Deposition of Flyash (Deponering af Flyveaske).
Apr 79, 15p ISBN-87-503-2914-6
Text in Danish, Abstract in English.

In the opinion of the Environmental Board, permanent deposition of flyash is not the right solution long-term since there is evidence that much of Denmark's flyash can be utilized in the production of cement and concrete as well as for road building. Nevertheless, there will be continued permanent deposition of some flyash as well as temporary storage. According to Report nr 12, December 1978 in the series 'Environmental Project,' the chemical composition of coal ash depends largely on geological and geographical factors associated with the coal field, burning conditions and the effectiveness of the smoke-purification equipment. Studies show that environmental effects can be lessened by careful planning, such as depositing flyash in controlled areas approved by local authorities or in special depots. Dumping at sea by creating an artificial island must be approved by the Ministry of Public Works in cooperation with various authorities, including the Environmental Board. The Ministry of Public Works must also approve the piping system whenever flyash is piped into the sea in accordance with a directive issued 18 May 1977. Waste-water drainage from such deposits at sea must be approved by local authorities in compliance with waste water regulations.

The Discount Rate in Road Engineering Studies.
Technical rept.,
F. X. Jurgens. Nov 79, 28p RT/66/79

The intention of the report is to provide the road engineer with a guide which covers the more important concepts behind the selection and usage of an appropriate discount rate for economy studies. The effects of inflation in this context are also clarified. It is recommended that if a discount rate is required without resorting to detailed calculation, a rate of ten percent be chosen, but if the road engineer wishes to make a more sophisticated study, he may undertake a sensitivity analysis to test the effects of a number of different discount rates.

An Evaluation of Existing Travel Demand Estimation Procedures for Long Term Urban Transportation Planning.
Technical rept.,
D. B. Rathbone. Oct 79, 141p RT/48/79

During the last few years a number of travel demand estimation techniques for long term strategic planning have been developed. The primary objective of this research project was to select, after quantitative analysis, the most appropriate technique for application in medium and large sized cities in South Africa. The functions, data needs, appropriate level of effort and the necessary accuracy for each different level of urban transportation planning intially were identified. This effort defined the objectives and scope of long term strategic planning. Various non-conventional planning techniques (e.g., techniques that do not follow the usual four-step procedure of trip generation, trip distribution, modal split and assignment) were then qualitatively evaluated in order to select the best technique for an quantitative evaluation against the simplified conventional planning technique.

Parametric Study of Potential Contaminant Transport at the Proposed Delmarva Power and Light Company Plant Site, Vienna, Maryland.
Final rept.,
Emil O. Frind, and Carl D. Palmer. Dec 80, 110p PPSP/JHU/PPSE-8-15

Sponsored in part by Johns Hopkins Univ., Laurel, MD. Applied Physics Lab.

The potential leachate transport in the groundwater under the proposed site is studied. The study is done on an idealized geologic cross-section and it involves a parametric analysis of time-varying contaminant concentrations generated by a nonlinear finite element model. Variable parameters include the waste pile deposition mode, the leachate entry mode, the rate of natural recharge, the leachate density, the hydraulic conductivity of the aquifer, and the dispersivity of the aquifer materials. Parameters are selected on the basis of field and laboratory data, except for dispersivity, which is estimated on the basis of values published in the literature. The waste pile is assumed to be open to precipitation. Rainwater is assumed to become chemically saturated in passing through the waste pile. Results indicate that a waste pile situated above the water table produces less contamination than one that is in contact with the water table. No significant density effect is found within the range of parameter values investigated. Concentrations within the leachate plume are found to stabilize progressively, the stable subregion appearing first under the source and expanding gradually downstream, while the tip of the plume continues to advance indefinitely. Maximum concentrations, when the waste pile is not in contact with the water table, are found to depend primarily on the rate of natural recharge and the size of the waste pile.

Economic Impact Analysis of Alternative Pollution Control Technologies: Wet Process and Insulation Board Subcategories of the Timber Products Industries.
Final technical rept.
Jan 81, 92p EPA-440-2-80-089

The Economic Impact Analysis Assessment of the Hardboard/Insulation board industry is a support document for the effluent limitations (Best Available Technology, Pretreatment Standard for Existing Source, Pretreatment Standards for New Source, New Source Performance Standards) promulgated pursuant to Sections 301, 304 and 306 of the Clean Water Act, on January 7, 1981. The report includes an industry characterization (processes, market structure and financial information), industry costs from compliance from the effluent limitations and an economic impact analysis for existing and new sources resulting from the effluent limitation. Wet process hardboard is made from inter-felted wood fiber, using a wet forming and either a wet or dry pressing process. Hardboard products include interior paneling, exterior siding and industrial use products. There are 16 wet process plant operated by 11 producers. In 1976, the median, after-tax profit for a 200-million-square foot wet process hardboard plant was about 7%; the industry range was from 1% to 13%.

Solid Waste: Methodology for Evaluation. Volume II: Analysis of Residual Wastes.
Final rept.,
Herbert C. Miller, Ruby H. James, and Walter R. Dickson. Dec 80, 349p
Contract EPA-68-02-2685
See also Volume 1, PB81-214900.

This report presents the results of a program of evaluation of analytical methods for 'Total Content' of residual wastes. Candidate methods were first studied and modified, and then evaluated by analyzing a variety of industrial residuals for a broad range of organic compounds and metals. The results, based on statistical analysis of over 10,000 data points, are quoted primarily in terms of observed accuracy and precision. The methods depend on extraction, gel permeation chromatography cleanup, preconcentration, and GC/MS analysis for identification and quantitation of semivolatile organics; purge-and-trap and GC/MS for purgeable organics; and acid digestion combined with AAS or ICP determinations for metals. An edited text of the evaluated methods is presented in the format specified by EMSL-Cincinnati for standard methods as an appendix to this report. Southern Research Institute and Battelle-Columbus Laboratories exchanged methodologies developed for Total Content and Potential Mobility and applied these procedures to the analyses of samples in an interlaboratory study. Results of SoRI's contribution to the interlaboratory study are presented in the appendices to this report.

Improving Surface Coal Refuse Disposal Site Inspections,
R. A. Meister, and R. L. Hoffman. Jun 80, 297p BUMINES-OFR-54-81
Contract J0188027
Color illustrations reproduced in black and white.

The study on improving surface coal refuse disposal site inspections included surface inspections of 15 refuse disposal sites. Monthly aerial photos were taken of the sites and computer methods were used to determine elevation changes. Photogrammetric techniques that were used are described in detail. A comparison of the results of each of these inspection techniques is included. A detailed evaluation of the photogrammetric techniques was made and conclusions were drawn concerning the advantages and disadvantages of using aerial photography and photogrammetry as part of the inspection procedure. Operators' opinions of the aerial photography methods are included.

Industrial Wastewater Reuse: Cost Analysis and Pricing Strategies,
G. P. Treweek, N. Hixson, P. Teigen, and K. Fox. Apr 81, 170p W81-03601, OWRT/RU-80/7
Contract DI-14-34-0001-8817
See also Appendices, PB81-215618.

This report discusses the overall planning procedures for a wastewater reclamation and reuse project, with emphasis on those unique steps not generally associated with a facilities plan. Several computer programs, designed to speed the calculations involved in determining the necessary wastewater treatment steps, the size and cost of reclaimed wastewater delivery systems, and present worth calculations, are presented as a means to simplify the overall planning procedure. The second section of this report deals with the development of pricing strategies for a wastewater reclamation and reuse project, which often will cross traditional boundaries between fresh water distribution and wastewater collection and treatment. Also presented are case histories which illustrate the application of the previously developed computer programs and pricing strategies.

A Study to Identify the Potential of Naturally Occurring Zeolites for Removing Heavy Metals from Water.
Final rept.,
Michael J. Semmens. 31 Mar 81, 173p W81-03608, OWRT-B-150-MINN(1)
Grant DI-14-31-0001-5013
Prepared in cooperation with Minnesota Univ., Minneapolis. Department of Civil and Mineral Engineering.

Extensive studies were conducted to characterize the heavy metal cadmium (Cd) and copper (Cu) removal behavior of clinoptilolite (CL). Acidic or alkaline pretreatment of CL appeared to increase its capacity, as measured by sodium displacement by potassium. Calcium was found to be a major competing cation for Cd and Cu exchange by CL, and was difficult to displace from CL entirely. Isotherm studies at two CL particle sizes showed no significant difference in metal behavior, indicating exchange was not a surface-controlled reaction. Column tests (using CL and synthetic strong/weak acid resins) for Cd and Cu removal, designed from batch isotherm study results, were conducted to identify the effect of several parameters on metal removal performance. Column results using alkaline-pretreated (one molar NaOH for a day) CL showed excellent agreement with the batch isotherm data. Regeneration of Cd-laden CL showed a rapid initial Cd release was observed unless NaCl was added. Regeneration of the Cd-laden synthetic resins could be accomplished completely and the extended tailing of Cd release seen with Cd-laden CL did not occur.

Audible Noise from High-Voltage Transmission Lines: Psychoacoustic Findings,
J. A. Molino, N. D. Lerner, and G. A. Zerdy. Sep 79, 13p
Proceedings of U.S. Department of Energy Environmental Control Symposium, held at Washington, DC. on November 28-30, 1978. Sponsored in part by Department of Energy, Washington, DC.
Pub. in Solar Energy, Geothermal Energy, and Waste Heat Transmission, v3 p243-255 1979.

The possible aversiveness of audible (corona) noise from extra-high voltage (EHV) transmission lines was investigated in a series of psychoacoustic experiments. Recordings of corona noise were made outdoors, generally at the edge of the property right-of-way. These recorded corona noise samples were then compared with other recorded environmental sounds, reference sounds, or spectrally-modified corona sounds, using a behavioral preference procedure. Results from three experiments, all employing the same general procedure, are presented here.

An Assessment of Water Use and Policies in Northern Colorado Cities,
Kelly N. DiNatale. Mar 81, 250p TR-28, W81-03603, OWRT-A-042-COLO(2)
Contracts DI-14-34-0001-9006, DI-14-34-0001-0106

Municipal water management policies and water use patterns were examined in 25 northern Colorado Front Range communities. Towns were classified on the basis of population; extent of metering, if any; and source of water supply, groundwater or surface water. Water use patterns were analyzed for a four-year period, 1975 to 1978. The effects of metering, water use restrictions and the 1976-1977 drought period on municipal water use were also determined. Metering of all residential customers was found to be the practice in 11 of the 25 communities.

Municipal Waste-Treatment Methods (Metoder for Behandling av Kommunalt Avfall).
Feb 78, 124p
Text in Swedish.

In response to a directive from the Nordic Council Secretariat, the Association of Swedish Sanitation Works collected and processed data from various designated Nordic waste treatment plants during 1976 and 1977 for the purpose of informing those in charge of processing municipal waste products. The data includes methods of burning, grinding, composting, pyrrolization and utilization, together with ongoing research and developmental projects. A total of 30 Nordic waste treatment plants were studied. The main problem in connection with burning and grinding lies in the sorting of waste products, according to the report; presorting would reduce operational problems. Because of the disparity in the data, no final conclusions can be drawn with respect to environmental effects or environmental protective measures. The report also deals with ongoing recovery and utilization of by-products, such as heat, slag and compost. Plant and treatment costs are given, but various factors, local as well as national, make it difficult to compare costs.

Kriging Analysis of Mean Annual Precipitation, Powder River Basin, Montana and Wyoming.
Final rept.,
M. R. Karlinger, and J. A. Skrivan. May 81, 32p
USGS/WRD/WRI-81/050, USGS/WRI-80-50

Kriging is a statistical estimation technique for regionalized variables that exhibit an autocorrelation structure. Such structure can be described by a semi-variogram of the observed data. The punctual-kriging estimate at any point is a weighted average of the data, where the weights are determined by using the semi-variogram and an assumed drift, or lack of drift, in the data. Mean annual precipitation is an important variable when considering restoration of coal strip-mining lands in the Powder River basin, Montana and Wyoming. Two punctual-kriging analyses involving data at 60 stations were made--one assuming no drift in precipitation and one a partial quadratic drift simulating orographic effects. Contour maps of estimates of mean annual precipitation based on a period of 10 years of data were similar for both analyses, as were the corresponding kriging errors.

Fugitive Emission Sources and Batch Operations in Synthetic Organic Chemical Production.
Final rept.,
Dwight G. Erikson, Farrel D. Hobbs, Owen D. Ivins, Victor Kalcevic, and William L. Troxler. May 81, 94p EPA-600/2-81-083
Contract EPA-68-03-2568
Portions of this document are not fully legible.

This survey report was developed for the EPA for use in assessing the potential magnitude of fugitive volatile organic compound (VOC) emissions from agitator seals, cooling towers and batch operations in the production of 378 designated chemicals. The information presented in this report has been developed based on a review of the available open literature. Included in this review were published articles and reports, selected state air emission inventory questionnaires, and trip reports from visits to specific plant sites. Information on the type of operation, i.e., batch or continuous, and the quantity of specific fugitive source types associated with each process was evaluated and overall

industry estimates were made. Tabular groupings were developed and are presented for each of the designated chemicals in Part A of this report. A qualitative assessment of miscellaneous fugitive VOC emissions unique to batch operations is presented in Part B of this report.

Waste Water Removal Outside Urban Districts (Spildevandsafledning Udenfor Bymaessig Bebyggelse).
Dec 78, 49p ISBN-87-503-2780-1
Text in Danish, abstract in English.

This report is a review of problems connected with waste water removal in small communities (less than 200 inhabitants) and in sparsely settled areas, including areas with summer cottages. About 1 million people live in such areas in Denmark, according to the 1970 census, and there are about 160,000 summer cottages in that country. Waste water removal is regulated by the Environmental Protection Law, which went into effect on October 1974, along with subsequent changes and proclamations from the Environmental Protection Ministry. According to the law, waste water questions are resolved by municipal and county authorities, the Environmental Protection Ministry, and the Environmental Appeal Board. In addition to Danish regulations, there are EC regulations to protect surface water and proposals for protecting groundwater. Work is underway to create waste water removal plans in all municipalities and counties. The report reviews various regulations pertaining to the discharge of waste water into rivers, lakes, ocean, and ground. Information concerning the granting, altering, and revocation of permits is given. Various types of toilet facilities are described and their relative merits discussed. Economic aspects of the various systems are also examined.

Also available in set of 4 reports PC E19, PB81-217646.

New control strategies have been developed for responding to freeway incidents. Two types of incident situations were considered. In Situation 1, control is only needed at on-ramps in the immediate vicinity of the incident site. In Situation 2, control is also needed on freeway segments and connectors located upstream of the freeway segment containing the incident. The strategies were extensively tested under a wide variety of simulated incident conditions. Guidelines on strategy selection and usage in an operational environment have been prepared. Functional requirements have also been developed for an on-line incident control strategy evaluator which could pre-test the merits of several candidate strategies. This first volume presents an overview of the study highlighting the research methodology, major accomplishments, conclusions, and recommendations for future research.

Customers in the European Community Countries should apply to the office for official publications of the European Communities, B. P. 1003, Luxembourg.

Part 1 of the Report examines the present and future patterns of coal production and consumption in the UK and their effect on possible future levels of emission of three major pollutants, viz., sulphur dioxide, nitrogen oxides, and particulate matter; some consideration is given to trace element concentrations. A detailed technical analysis of the coal supplied and consumed according to consumer type and geographical regions is presented. Current coal preparation practice in the UK is described as well as its effect on sulphur content and the principal UK air pollution legislation. Part 2 includes an examination of the feasibility and economics of pollutant reduction during production and combustion processes with particular reference to such developments as fuel desulphurization, flue-gas washing and fluidized-bed combustion. Contract NBS-78-3603
See also Volume 1, PB80-187610.

This study is part of a research series by ETIP about the impacts of air pollution regulation on industrial innovation and creativity. It treats the results of periodic review of standards for new source performance. This review was mandated in order to incorporate technological advances that take place since the standards' original formulation. In fact, the study shows that revisions are seldom made raising the question as to whether technological advances are overlooked or are non-existent.

Incentives for Technological Innovation in Air Pollution Reduction: An ETIP Policy Research Series. Volume 8: Controlled Trading and Site-Specific SIP Revisions: Competing for Attention in a Crowded Administrative Route.
Interim rept.,
Jay Evans. Dec 80, 108p NBS-GCR-ETIP-81-95
Contract NBS-78-3603

This report, one of a series of factors regarding the impacts on innovation of new regulatory incentives, deals with the administrative route being followed by 'controlled trading' incentives. The report presents case studies and analysis showing how the success of these new reforms is endangered by the slowness of the administrative route for approval in a State Implementation Plan (SIP).

Pilot-Scale Anaerobic Filter Treatment of Heat Treatment Liquor.
Final rept. Nov 76-Dec 79.
Jul 81, 116p EPA-600/2-81-114
Contract EPA-68-03-2484

This investigation was undertaken to demonstrate the application of the anaerobic filter in the treatment of liquor waste resulting from heat treatment of raw sludge in municipal sewage treatment plants. The liquor which contains high concentrations of soluble wastes is often returned to the heat end of a plant, where it can impose an additional load on the plant's operation and reduce its efficiency. Two pilot anaerobic filter columns were operated over a period of 18 months at the Muddy Creek Plant of the Metropolitan Sewer District of Greater Cincinnati. Operational data demonstrated high levels of BOD and COD removals from the raw heat treatment liquor. The generated gas contained 65 to 70 percent methane. Based on the pilot column studies, a suggested design and costs for an anaerobic filter unit were developed. These costs were compared to costs of other means of treatment such as the aerobic alternative. The anaerobic filter process had lower capital and operating costs than other modes of treatment. The gas produced was calculated to provide fuel to maintain the temperature of the filter at 35C, and provide additional capacity for other plant uses. These calculations show a net profit in operating costs. Further investigations to optimize design configurations are suggested.

Innovation in Public Transportation. A Directory of Research, Development and Demonstration Projects. Fiscal Year 1980.
Annual rept. 1 Oct 79-30 Sep 80.
Apr 81, 274p UMTA-MA-06-0086-81-1
Contract UMTA-MA-06-0086

The report contains descriptions of current research, development, and demonstration (RD&D) projects sponsored and funded by the Urban Mass Transportation Administration (UMTA) of the Department of Transportation. This Directory focuses on activity that took place in Fiscal Year 1980, which began on October 1, 1979 and ended September 30, 1980. Section 6 of the Act pertains to research, development, and demonstration projects in all phases of urban mass transportation, which includes technology development and deployment, service and methods demonstrations, and transportation planning and management. Under Section 8 of the Act, funds are authorized each year to conduct local transportation planning studies, otherwise known as Technical Studies. A portion of these Technical Studies funds are also used annually for Special Studies to help local planning agencies and UMTA improve the quality of information used for local transportation planning. Section 11 of the Act authorizes a program of University Research and Training Grants. These grants are designed to contribute to UMTA's research and to stimulate professional growth in fields relating to transportation.

Evaluation of Base Courses for Flexible Pavements.
Final rept.,
W. G. Mullen, and B. D. Barnes. Feb 81, 100p
ERSD-110-67-5, FHWA/NC-81/002
Prepared in cooperation with North Carolina Dept. of Transportation, Raleigh. See also Aug 70, PB-197 162.

Nineteen pavement sections monitored over a period of approximately ten years have been evaluated to determine the influence of base course parameters on the performance of primary flexible pavement systems in Piedmont, North Carolina. The research relied essentially on the Present Serviceability Rating concept as a measure of performance. The findings of the research indicates roughness measures are insensitive to changes in subjective performance, present design procedures are adequate and probably conservative, at least, for the pavements studied. Bituminous concrete base courses are not necessarily structurally superior to coarse aggregate base courses, and Benkleman beam deflections are poor indicators of performance.

Example of Approval for Operating a Business According to the Environmental Protection Law, Section 5 (Eksempel pa Virksomhedsgodkendelse efter Miljoebeskyttelsesloven Kap. 5),
Jens Kampmann. Dec 78, 17p ISBN-87-503-2770-4
Text in Danish, abstract in English.

According to the Environmental Protection Law certain businesses, listed in the appendix to the law, must receive approval from environmental authorities to operate or to increase their operations in such a manner that would cause a higher level of pollution emanating from the plant or site in question. Since many local environmental administrators have requested that guidelines be given for writing certificates of approval for such businesses, the Environmental Protection Office has composed a sample approval for operating a business in conformity with the Environmental Protection Law. It is stressed that this sample is not the only possible format, but that is satisfies the requirements of the Environmental Protection Office. The document is written to approve the operation of a fictitious machine works. The exact location of the plant and the estimated time of construction and beginning of operations are indicated. A detailed description of activities planned at the plant are given, along with their anticipated impact on the environment. Limitations on emissions, noise, and waste disposal are presented.

Socioeconomic Analysis of Hazardous Waste Management Alternatives: Metholology and Demonstration.
Final rept.,
Graham C. Taylor. Jul 81, 275p EPA/600/5-81/001
Grant EPA-R-804661

A methodology for analyzing economic and social effects of alternatives in hazardous waste management is presented and demonstrated. The approach includes the use of environmental threat scenarios and evaluation of effects on and responses by parties-at-interest. The methodology is demonstrated by a case study of alternative approaches to hazardous waste management for Oregon. The report organizes, summarizes, and provides extensive information on hazardous waste management techniques. Research on risk preferences and its relationship to decision-making is reviewed, and appendices on methods for valuing various effects (such as environmental impacts), public attitudes toward environmental issues, and intergenerational discounting are included. The report constitutes a useful manual for hazardous waste management personnel and policymakers involved in environmental quality management.

The Role of Agricultural Practices in Fugitive Dust Emissions.
Final rept.,
Thomas A. Cuscino, John S. Kinsey, Richard Hackney, Russel Bohn, and R. Michael Roberts.
Jun 81, 264p ARB-R-81/138
Contract ARB-A8-125-31

For the San Joaquin Valley, the Sacramento Valley, and the Imperial Valley, Midwest Research Institute quantified the impact of agricultural operations on fugitive dust emissions. Thirteen tests were performed in the spring of 1980 to quantify emission factors from discing, land planning, and vehicles traveling on unpaved farm roads. Six tests were performed in the fall of 1980 to quantify emission from sugar beet harvesting. Since fugitive emissions from a given operation can vary depending on physical properties of the soil or equipment, and depending on climate, predictive emission factors were developed to relate total inhalable and fine particulate emission factors to important independent variables. Significant relationships were determined between the emission factor and the soil silt content. An inhalable particulate emission inventory performed for the three valleys showed that in 1978, agricultural operations produced 148,000 Mg/year of fugitive dust less than 15 micrometer in aerodynamic diameter. Field crops yielded the most significant emissions while soil preparation was the most significant category of operations. Two categories of control techniques were suggested: (a) those that included control equipment to be added to the farm implement and (b) those that included operational modifications. Control efficiencies and potential emission reductions were estimated for these control techniques.

Best Management Practices Guidance, Discharge of Dredged or Fill Materials,
Robert E. Thronson. Sep 79, 100p EPA/440/3-79-023, EPA/440/3-79-028

Before any decisions can be made regarding the discharge of dredged or fill materials into waters of the United States, all probable impacts and feasible alternative sites must be considered. This will include evaluation of such factors as the necessity for discharges; sensitivity of the area to environmental impacts, both long and short term; possible alternative sites or a scheduling of operations; and effectiveness of available site-specific Best Management Practices to prevent, or minimize the impacts. Discharges of dredged or fill materials must comply with guidelines prepared by the Administrator of EPA pursuant to Section 404 (b) (1) of Public Law 95-217. This 'Best Management Practices Guidance' document has been prepared to provide State and areawide water quality management agencies, other State and Federal agencies, and the concerned public with information on readily-available processes, procedures, methods, and techniques that can be used to minimize or prevent environmental impacts that could result from the discharge of dredged or fill materials. It has been written in a manner that the reader does not have to be an expert in the discipline to be able to understand what the problems are and some of the solutions that are presently available.

Guidance for BAT-Equivalent Control of Selected Toxic Poliutants.
Final rept.,
James W. Patterson. May 81, 40p EPA-905/2-81-003
Prepared in cooperation with Patterson Associates, Chicago, IL.

This manual is intended to provide guidance to federal and state NPDES permit and pretreatment staffs in determining appropriate limitations for the discharge of selected toxic pollutants in the wastewater from industrial facilities where applicable Effluent Guidelines regulations are not available. From his extensive knowledge and comprehensive review of the treatment technology available to industry, the author has determined, in his best professional judgement, the final effluent concentrations that can be achieved using his estimate of best available technology (BAT) for the following toxic pollutants: arsenic, barium, cadmium, hexavalent chromium, total chromium, copper, cyanide, fluoride, iron, mercury, nickel, silver, and zinc. It is concluded that, aside from a few extraordinary situations involving unusual chemical interferences, the treatability levels provided in the manual should be applicable, independent of industrial category.

Detection and Interpretation of Trends in Oxidant Air Quality.
Final rept.,
Lowell G. Wayne, Katherine W. Wilson, and Clarence L. Boyd. Oct 76, 129p EPA-450/3-76-034
Contract EPA-68-02-1890

Trends in ambient levels of oxidants over periods of five years or more are reviewed for seven locations in the United States. Statistically significant downward trends were identified in the San Francisco Bay Area and in Denver. Trends in emissions of organic and NOx precursors over comparable periods are also reviewed. Only in San Francisco were the data sufficient to note a statistically significant relationship between precursor emission trends and the trend in ambient oxidant. Downward oxidant trends are most pronounced in the western part of the Bay area. Indications are that a five year period may not be sufficient to identify statistically significant trends in many areas. Downward trends in the Bay Area are much more pronounced when 13 years of records are examined.

Effects of Planform Geometry on Tidal Flushing and Mixing in Marinas.
Final rept. Oct 78-Sep 79,
R. E. Nece, E. P. Richey, J. Rhee, and H. N. Smith. Jun 81, 84p EPA/600/3-81/039
Grant EPA-R-806146

Physical hydraulic models of marinas possessing rectangular planforms were tested to determine effects of various geometrical parameters on tidal flushing and internal circulation in small harbors. Parameters investigated were: (1) Planform geometry aspect ratio; (2) ratio of entrance cross-sectional area to basin planform area; (3) effect of rounding of corners in the basin interior; (4) orientation and location of a single entrance; (5) effect of two entrances versus a single entrance. It is concluded that for rectangular planform basins, optimum exchange is achieved when the basin length to width (aspect) ratio lies between 0.5 and 2.0, the interior corners are rounded and the single entrance centrally located on the seaward side of the harbor. Rounding has little effect on average flushing but does increase the uniformity of local exchange throughout the basin. Results were obtained through a photographic technique incorporating the use of a photodensitometer.

Small Fishing Ports in Southern New England, Volume Ib.
Final rept.,
John J. Poggie, James M. Acheson, and Richard B. Pollnac. 1980, 119p NSF/RA-800550
Contract NSF-AER77-06018
See also 1980, Volume 1, PB81-149080.

Social and cultural aspects of fisheries management were examined to establish basic data on the fishing communities and fisheries of southern New England. Five small ports were selected for study--Newport, Chatham, and Westport, Massachusetts; Newport, Rhode Island; and Stonington, Connecticut. These ports differ in terms of local, social, and geographical conditions, fishing styles, and emphases. Results of the study show that these ports act as a backup for the industry as a whole by (1) providing sources of fish for local markets; (2) using low energy models which reduce energy costs; (3) allowing individual fishermen a greater opportunity to find a port to suit their life-style; and (4) complementing tourist activities by supplying fresh seafood products. However, a conflict was found to exist between the commercial fisheries and businesses operating largely on the summer tourist trade. More money has been added to the local economy from the latter, resulting in restricted development of commercial fishing.

EPA Coal Cleaning Program.
Progress rept. Oct 78-Sep 79,
J. Moore, D. Sargent, and B. Hylton. Apr 81, 95p EPA-600/7-81-070
Contract EPA-68-02-3136

The report describes work during Fiscal Year 1979 by 12 organizations, both public and private, under EPA's Coal Cleaning Program, a program that explores the possibilities for wider use of coal as an environmentally acceptable energy source. Many aspects of coal were studied, including the use of low sulfur coal, removal of coal sulfur by coal cleaning, and measurement of emissions from the cleaning processes. Seventeen projects were active in three major research categories: environmental assessment, technology assessment and development, and pollution control technology. Several projects were aimed at achieving a better knowledge of the characteristics of estimated coal resources. One approach was to develop and understanding of the effects of geologic formation processes on the properties of the resulting coal--especially sulfur and ash content. Another was to develop empirical data bases from multiple source sampling programs, past and present, to help identify constituents of coal deposits and relate them to environmental and economic concerns. Other studies evaluated certain coal cleaning techniques, equipment, and systems to assess possibilities for their improvement. Alternative strategies were explored for compliance with SO2 emission rules for coal combustion, as were assessment and control of pollution from coal cleaning.

Vapor-Phase Cracking and Wet Oxidation as Potential Pollutant Control Techniques for Coal Gasification.
Final rept. Nov 76-Apr 81,
W. J. McMichael, S. K. Gangwal, D. A. Green, and F. O. Mixon. Jun 81, 56p RTI/1934/00-01F, EPA-600-7-81-096

The report gives results of an investigation of two techniques (hydrocracking of heavy organics in the raw gas prior to quency, and wet oxidation of the gasifier condensate) for pollutant control in coal gasification processes. Bench-scale experiments were used to determine rates of hydrocracking and wet oxidation as a function of process conditions and catalyst used. A microreactor system, capable of holding 1.0 cc of material to be screened for catalytic activity, was used in the hydrocracking studies. Benzene and alkylated benzene compounds were used as model compounds in determining the potential of various materials for cracking rates. Thiophene was used as a model compound for catalyst poisoning studies. Cracking rates were determined for coal-derived materials produced from bituminous and subbituminous coals and materials containing iron and nickel compounds. Experiments were carried out at 300 to 800 C and approximately atmospheric pressure. The most promising material screened was a triply-promoted iron oxide ammonia synthesis catalyst. It had the greatest activity at temperatures of practical interest for a control device and showed more sulfur resistance than the other materials screened. However, the catalyst was poisoned by sulfur: attempts to regenerate it by air oxidation were unsuccessful. Wet oxidation appeared competitive.

This report represents the initiation of a program to determine the types of sources of priority pollutants and the magnitude of their contribution to publicly owned treatments works (POTW). The initial phase, described in this report, is designed to study the non-heavy industry contributors. Thus, residential, commercial and light industry-type sources have been identified as those of primary interest. The complete study is to be carried out in phases and this report describes the result of the first phase of the program which was designed to develop a general approach, obtain background information, test alternative procedures and develop the basis for detailed planning of the full study. A detailed quality control program was implemented for this study. A total of 69 composite samples were collected for the generation of 140 samples for analysis, the increment coming from the quality control program. Samples were analyzed for all 129 priority pollutants (excluding asbestos) plus manganese and the classical parameters of pH, TEMP, TSS, TOC, BOD, COD, ammonia, oil and grease. Approximately 20 organic species were detected in the POTW influent and sewer samples, mostly at concentrations near the detection limit. Only several organic species were found above 10 mg/l, namely chloroform and other halomethanes, phenol, toluene and naphthalene (each at one sewer site) and three phthalates.

See also Volume 2, PB81-219644 and Volume 4, PB81-219669.
Also available in set of 5 reports PC E99, PB81-219636.

This report represents the second in a series of studies of sewage treatment basins undertaken in order to determine the relative importance of major sources of pollutants found at the influent of publicly-owned treatments works (POTWs). The general categories of residential, commercial and industrial have been identified as appropriate classifications for this study. This second study was carried out in the drainage basin of the Coldwater Creek treatment plant in the metropolitan St. Louis, Missouri area. In contrast to the predominantly residential character of the Muddy Creek basin in Cincinnati, the Coldwater Creek basin area had a reasonable amount of flow from commercial and industrial sources in addition to the residential flow. The relative flow from these source types in the basin was: Residential: 78%, Commercial: 10%, Industrial: 12%.

Also available in set of 5 reports PC E99, PB81-219636.

A study has been carried out to determine the relative significance of the major sources type-residential, commercial, industrial-contributions of priority pollutants to POTW influents. A service area in each of four cities--Cincinnati, St. Louis, Atlanta, and Hartford--has been studied in detail. In each city, specific sampling sites were selected to represent each of the major source categories. In total, 11 residential, 10 commercial and 5 industrial sites have been sampled, in addition to the tap water and POTW influents. This report presents a summary analysis of the data made possible by integrating the results obtained from each of the cities and treating the data by source category. The data have been analyzed to determine the frequency of occurrence of toxic pollutants (specifically the list of 129 priority pollutants), their concentration levels, the sources of these pollutants, and the impact of the source contributions on the POTW influent. Manganese and several classical parameters (7XX series) were also measured and included in the data base. The analysis has been carried out within the constraints imposed by the inherent characteristics of each of the major source categories - residential, commercial, industrial - concerning the range of discharge levels which was observed for each category.

Historic Bluff Recession Along the Lake Ontario Coast, New York,
Thomas Drexhage, and Parker E. Calkin. Jan 81, 133p NOAA-81042817

Coastal erosion along lakes and oceans significantly affects coastal activities, resources, and property values. Experience shows that attempts to control natural forces (such as erosion) based on partial knowledge are sometimes disastrous. Therefore, a workable model of the forces involved in natural erosion needs to be established before attempting large experimental projects in erosion control. One component of coastal process - bluff recession - is measured and analyzed. Rates of bluff line recession at 250 sites in six counties along the coast of Lake Ontario were measured.

Ridesharing: A Practical Transportation Alternative.
Rept. for 1 Sep 80-1 May 81,
Peter Derrick, Kathryn Stathakis, and Fran Komansky. May 81, 60p
Prepared in cooperation with the New York Legislative Commission on Critical Transportation Choices.

The report discusses ridesharing as an energy efficient mode of transportation. Broadly defined, ridesharing means two or more individuals traveling by a common mode of transportation. This report focuses on vanpooling, a form of ridesharing which enables 7 to 14 passengers to share rides to and from their work sites. The first section of the report highlights the various types of vanpools in operation across the country. Three types of vanpool programs exist: employer-based vanpools, third-party vanpools and employee owned and operated vanpools. That section is then followed by a summary of federal involvement in ridesharing. After that, the actions that various states have taken to encourage ridesharing are discussed. The last section of the report summarizes ridesharing efforts in New York, concluding with a number of recommendations aimed at rapidly increasing the number of vanpools in the state. •

Control Techniques for Sulfur Oxide Emissions from Stationary Sources. Second Edition.
Apr 81, 560p EPA-450/3-81-004
Contract EPA-68-02-3173
See also PB-190 252.

Control Techniques for Sulfur Oxide Emissions From Stationary Sources presents recent developments of control techniques which have become available since preparation of the first edition of Control Techniques for Sulfur Oxide Air Pollutants PB-190 252. This edition presents available data on characterization and sampling methods for sulfur oxides, descriptions of stationary sources of sulfur oxides and control techniques used to reduce sulfur oxide emissions. Control costs and energy and evironmental impact of controlling sulfur oxide emissions are also discussed.

State Water Conservation Planning Guide.
Oct 80, 108p
Prepared in cooperation with Brown and Caldwell, Walnut Creek, CA.

The guide provides information on water conservation activities by all levels of government concerned with water resources management. It suggests a series in conduct of water conservation activities as an integral part of water resources planning. The guide contains a detailed bibliography of references that will be useful in planning for more efficient use of water. A number of optional planning procedures are described in the guide which can be selectively applied to match water resources conditions and the current stage of planning in any State.

Regulatory Decision Process and Its Consequences for Market Innovation.
Final rept.,
O. A. Davis, and R. B. Greene. Nov 79, 90p
NSF/PRA-7621012
Contract NSF-PRA76-21012

A chronological history is presented of studies concerned with the regulatory decision process and its consequences for market innovation. The first few chapters rely heavily on neo-classical economics, paradigms, and arguments; later chapters supplant the more untenable assumptions with more realistic and seemingly useful descriptions focusing on intra-organizational considerations rather than market phenomena. Individual chapters are devoted to (1) the topics of electric utility rate structures in achieving social innovations; (2) the use of advanced statistical techniques where previously simplistic and subjective methodologies were used; (3) the discrepency between commissioner and staff goals in developing a behavioral theory of resource allocation within the agency; and (4) development of a theoretical model of utility rate making which considers the behaviors of

regulated firms, the commission, and consumers; and a focus on the internal rate making processes of the Pennsylvania Public Utility Commission (PUC) after developing an organizational processes paradigm.

EPA is developing new source performance standards under Section III of the Clean Air Act and national emission standards for hazardous air pollutants under Section 112 for volatile organic compound emissions (VOC) from organic chemical manufacturing facilities. In support of this effort, data were gathered on chemical processing routes, VOC emissions, control techniques, control costs, and environmental impacts resulting from control. These data have been analyzed and assimilated into the ten volumes comprising this report. This volume contains a brief history of the four year project and includes emission ranking information for 140 manufactured organic chemicals.

Recent Advances in Our Understanding of Salt Marsh Ecology,
Armando A. de la Cruz. 1980, 17p MASGP-79-012, NOAA-81042916
Grant NA79AA-D-00049
Pub. in Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, held in Albuquerque, NM, FWS/OBS-80/30 214p 1980. See also report dated May 80, PB80-197692. Prepared in cooperation with Mississippi State Univ., Mississippi State. Dept. of Biological Sciences.

Our understanding of the ecology of coastal marshes has revolved about the role of this ecosystem as a source and reservoir of energy and nutrients, and as a vital habitat for certain life stages of a number of marine organisms. While recent advances in salt marsh ecology have emphasized the metabolic processes and material fluxes that permeate the marsh-estuary, current research developments are geared towards a better understanding of the marsh as a carbon sink.

The Effects of Highway Construction of Sediment Discharge into Blockhouse Creek and Steam Valley Run, Pennsylvania.
Executive summary (Final),
Robert A. Hainly. Nov 80, 7p USGS/WRI-80-68, FHWA/PA-80/7225
See also PB81-202202. Sponsored in part by Pennsylvania Dept. of Transportation, Harrisburg. Office of Research and Special Studies.

From October 1972 through September 1977, the effects of highway construction in the 38 square mile Blockhouse Creek basin were studied. Water discharge suspended-sediment discharge, and stream-temperature data were collected at four stations in the basin. The 5-year period included 1 year before construction, 2 years during construction, and 2 years after construction. The effects of stream relocation and sediment-control methods used in the highway construction were also investigated.

Reuse of Municipal Wastewater by Volunteer Fresh-Water Wetlands (Vermontville, Michigan).
Summary rept. (Final),
F. B. Bevis. Feb 81, 19p NSF/CEE-81010
Grant NSF-ENV78-20273
See also PB-299 262 and PB81-221830.

The Vermontville, Michigan wastewater treatment system constructed in 1970-71 to treat domestic flows for a design service population of 975 is described. The system is based on stabilization pond-upland irrigation systems which were first designed in Michigan in response to rural community needs for affordable secondary-level treatment and phosphorous removal. Studies done at Vermontville include investigations on (1) water quality from the component collection and treatment facilities; (2) profiles of soils beneath the fields; (3) vegetation types, abundance, and communities; (4) vegetation biomass and phosphorous, and nitrogen uptake; (5) wet and wildlife habitat and comparison to ambient natural wetlands; (6) survivability of sensitive plant species; and (7) capital and O & M cost comparisons. Results of this work and of similar systems in other Michigan communities--Paw Paw, Kinross/Kincheloe, Lake Odessa, and Leoni Township--are presented. A major finding was that the plant-uptake is ineffective as a phosphorous-removal mechanism.

Liners of Natural Porous Materials to Minimize Pollutant Migration.
Final rept. Oct 75-Sep 77,
Wallace H. Fuller. Jul 81, 86p EPA-600/2-81-122
Grant EPA-R-803988

When landfills are not completely impermeable then underlying groundwater may be contaminated by leachate constituents if these are not adequately retained by soils. Research on industrial waste disposal has centered on use of manufactured products such as plastics and cementing roadbed materials such as asphalt and concrete to alleviate this problem by completely preventing liquid movement out of the landfill. Little attention has been given to use of natural low-cost materials as barriers for minimizing pollution migration out of landfills by retaining contaminants from liquids as they pass. This is a report of the relative effectiveness of natural low-cost liners of crushed limestone, clayey soil, hydrous oxides of iron, and crushed pecan hulls for minimizing the migration of Be, Cd, Cr, Fe, Ni, Zn, and total organic carbon constituents of municipal solid waste landfill leachates. Several leachate variables such as aqueous dilution, aeration, pH, and flux were also studied for their effect on movement of metals through 11 representative U.S. soils. The research was conducted on a laboratory scale using soil columns as a first step in screening for potential liners and manipulation practices. Limestone and hydrous iron oxide were found to be potentially useful as porous liners for retention of metallic leachate constituents. The amounts of these materials in natural soils were also found to be useful predictors of contaminant removal.

Mixing Phenomena in Industrial Fume Afterburner Systems.
Topical rept. Aug 79-Jun 81,
A. A. Putnam, and H. A. Arbib. Jul 81, 107p EPA-600/7-81-110, IERL-RTP-1224
Contract EPA-68-02-2629
See also PB-298 465.

The report reviews the physical-mixing phenomena involved in the reactions that occur in afterburners or fume incinerators. It considers mixing in after-burners from three points of view. It first covers typical designs of afterburner components that are involved in the mixing phenomena: with the paucity of performance information available, there is no clear-cut indication of the superiority of any particular design. Secondly, it considers the possible application of mathematical modeling principles developed for studies of conventional furnaces to afterburner design: although the problem for the afterburner is basically simpler, practical application of mathematical modeling still seems some time off. Thirdly, it presents empirical relations available in the literature for describing the performance of jet flow systems similar to various afterburner components: these relations permit an estimate of time/temperature histories of various flow paths through different afterburner designs. Overall, the design of adequate afterburners from the mixing point of view seems well within the current state of the art.

Control of Utility Boiler and Gas Turbine Pollutant Emissions by Combustion Modification--Phase II.
Final rept. Jun 76-Jun 79,
E. H. Manny, and A. R. Crawford. Mar 81, 178p EE.5E.81, EPA-600/7-81-039
Contract EPA-68-02-1415
See also PB-281 078.

The report gives results of Phase II of a field study to assess the applicability of combustion modification (CM) techniques to control NOx and other pollutant emissions from utility boilers and gas turbines without causing deleterious side effects. Comprehensive, statistically designed tests were used to evaluate the effect of CM. The most extensively studied CM for utility boilers was staged firing at low excess air, which can reduce NOx emissions by up to about 50%, based on results of short-term tests. Tests of B and W's low-NOx, dual-fired utility boilers, special attention was paid to the determination of potentially adverse side effects: increased combustible emissions, unwanted changes in particulate mass loading and size distribution, reduced boiler efficiency, increased furnace slagging, and tube wall corrosion. Short-term tests indicate that staged combustion may be applied to coal-fired utility boilers. The extent of furnace tube wall corrosion and slagging could not be determined conclusively, based on results of short-term (300-hour) corrosion probing runs under low NOx and baseline operating conditions. It was found, however, that corrosion probes exposed for longer periods (300-1000 hours) may more effectively correlate with actual furnace tube corrosion rates.

Also available in set of 3 reports PC E99, PB81-222440.

On October 9, 1970, Jonathan Development Corporation (JDC) entered into a Project Agreement with the United States of America, to develop a New Community in Carver County, Minnesota. Under the terms of the Agreement, the United States committed to guarantee $21 million of the Developer's borrowings for land acquisition and development. Accordingly, pursuant to the Agreement, a total of $21 million of Federally guaranteed Title IV (of the Housing and Urban Development Act of 1968) debentures were issued in two series: $8 million in October, 1970, and $13 million in June, 1972. Under the terms of the Agreement, the Developer initiated development of a new community in accordance with an approved Development Plan. However, as the result of severe financial difficulties brought about by changing market conditions, development of Jonathan has stalled. A number of alternative Development Plans have been proposed for action by NCDC. This Final Environmental Impact Statement evaluates the potential impact of six alternative development plans, including the plan as originally approved in 1970, on the environment.

Evaluation of Lixiviation of Mine Wastes.
Open file rept. (Final),
K. L. Bainbridge, M. A. Wilkinson, and B. M. Mahar. Dec 80, 243p BUMINES-OFR-73-81
Contract J0199057

This report describes the results of a study to determine which types of, and to what extent, mining wastes can contaminate ground water through leaching of acid-forming or potentially toxic constituents. The primary focus of this study was on coal mining wastes, especially overburden spoils and preparation plant refuse. In addition, the potential for contamination by leachates from clean coal stockpiles was also examined. The study approach included investigation of the amounts and geographic locations of mining wastes in the United States; the chemical character or mining wastes, especially with regard to potentially acid-forming or toxic constituents; and the extent to which acid and/or toxic components are leached from mining wastes by rainwater. To evaluate the leachability of coal wastes, a laboratory waste leaching method was developed to specifically simulate the leaching process over a long term. Waste samples were also leached by the EPA extraction procedure and ASTM waste leaching method. Results of the three leachtest methods were compared to evaluate their relative capabilities to predict the leachability of mining wastes.

This study develops the data base and an economic analysis of the primary sectors prerequisite to the regional projection of the supply side of the U.S. sulfur industry. The probable future course of sulfur pollution and process control in the United States and elsewhere as it impacts, by the production of sulfur values, the domestic Frasch industry, is estimated. A regional determination of the present and future U.S. sulfur supply market is presented.

Sulfur recovery from domestic sour natural gas and petroleum refining is estimated on a current basis and projected to the mid-1990's on a regional basis. The former depends importantly on gas production projections for the Overthrust Belt and the associated H2S. The latter depends largely on projected increases in the sulfur content and weight of imported crude oils, total crude oil imports, and anticipated refinery response.

See also Volume 2, PB81-222929. Sponsored in part by Pennsylvania Dept. of Transportation, Harrisburg.

The disturbance of land by construction is almost invariably accompanied by sudden, sometimes drastic increases in potenial for soil erosion. The amount of sediment eroded and delivered to a stream should be minimized within practical economic limits. The degree of control will vary depending upon the location of the construction site and the consequences of increased sediment to the local environment. Effective erosion control begins in the planning and location of the highway route. Control of water and knowledge of the soils to be encountered are basic in determining measures for preventing erosion and the movement of sediment. If a highway location is selected with consideration of problems associated with these basic elements, erosion problems during construction will be greatly reduced. This report presents a prediction method to determine soil erosion from highway construction sites. The method utilizes a regression type equation developed from actual data collected from three central Pennsylvania highway location sites. The developed equation is

similar to the Universal Soil Loss Equation and is used to predict erosion on a per storm basis.

A Procedure to Predict Sediment Flow From Highway Construction Sites Volume II.
Final rept.,
A. C. Miller, E. L. White, and W. Veon. Jan 81, 49p FHWA/PA-81/002
See also Volume 1, PB81-222911. Sponsored in part by Pennsylvania Dept. of Transportation, Harrisburg.

The Hydrology Laboratory of The Pennsylvania State University in a cooperative effort with the U.S. Geological Survey, Federal Highway Administration, and the Pennsylvania Department of Transportation was given the task of digitizing stream flow data, sediment graphs, turbidity hydrographs, and rainfall mass curves as measured downstream from highway construction sites. The purpose was to create a data bank that would be used in developing a sediment-predictive method for highway construction sites in Pennsylvania and be a source of information for other researchers. Besides the hydrologic data many construction parameters were also included (e.g. phase of construction, season of the year, type of soil, area cleared and grubbed). Sediment in streams resulting from highway construction was monitored for 11 sites within three different drainage basins in central Pennsylvania. Rainfall, stream flow (stage versus time), sediment concentration, and turbidity hydrographs have been evaluated for a number of storm events. Stream and sediment gauging to record flows and collect samples was done at prescribed intervals; intervals were smaller when there were rapid changes. Therefore, the runoff, sediment, and turbidity hydrographs were accurate to + or - 15 minutes. Stream flow data were available before, during, and following construction. In addition, one gauged watershed within each of the three drainage basins had no construction within the basin and was used as a control.

Resource Recovery from Plastic and Glass Wastes.
Final rept.,
Jon Huls, and Tom Archer. Jul 81, 161p EPA-600/2-81-123
Contract EPA-68-03-2708

This research program was initiated with the overall objective of assessing and evaluating State-of-the-Art for recovery of glass and plastic from solid waste. Literature was gathered from numerous sources, contacts were made with industrial and recycling organizations, and questionnaires were distributed among applicable firms involved in glass and plastic recovery. Data derived from literature was collected, reduced and evaluated for technical, economic, and environmental content. Both glass and plastic industries were characterized by processes, material flows, economic dynamics, and waste generated. Methods for recovery, (e.g., collecting, aggregating, processing and transportating), and recycling were identified. Economic and environmental parameters are provided. Currently, labor-intensive source separation of glass and plastic predominate, although mechanical recovery will achieve greater importance in the years ahead. Finally, research activities and State-of-the-Art activities in foreign countries are identified. Where feasible, their relative importance is assessed.

R. E. Morris, and K. S. Merrill. Jun 81, 154p
DOT-TSC-RSPA-81-1
Contract DTRS-57-80-C-0031

The research analysis has been directed toward (1) developing a realistic, quantitative description of the structure of the economic zones that are centered upon medium-size urban areas, (2) determining the nature of traffic in manufactured goods which are most susceptible to intermodal transportation, and (3) identifying trends in the surface freight transportation environment to 1990 and beyond. The range and dispersion of the statistical data which describe each of the 13 urban areas that have been examined (three are adjacent city-pairs with a coalesced economic vitality) disclose the lack of a pattern of surface freight transportation services among medium-size communities. All of the traffic in fabricated commodities can be efficiently moved in intermodal service. Both the motor carriers and the railroads evidence either an open mind or a firm commitment to mutually beneficial intermodal ventures. Intermodal freight service will become the shippers' preferred option when (1) intermodal trains are given precedence and scheduled service becomes dependable, (2) rail and motor carriers establish transregional intermodal corridors as cooperative mutually profitable ventures, (3) organized labor evaluates the potential benefits of intermodal operations to its members, and (4) the hub concept of strategically located profitable intermodal facilities has been implemented throughout the rail industry.

Inorganic Contaminant Removal from Drinking Water by Reverse Osmosis,
Martin R. Huxstep. Jul 81, 73p EPA-600/2-81-115
EPA-R-805207

The experimental data show the high-pressure system to be much more effective than the low-pressure system for the removal of all contaminants and natural constituents. The high-pressure system had rejections ranging from 78 to 99 percent, and the low-pressure system from 20 to 85 percent. Rejections varied with the specific contaminants, but the order from best to least was the same for both systems: arsenic V, fluoride, arsenic III, and nitrate. Because of the low rejections, the low-pressure system was able to achieve the EPA maximum contaminant levels when the feed water concentrations were only slightly above them.

Contract EPA-68-02-2197
See also Volume 3, PB81-145195.

The report characterizes air emissions from industrial external combustion sources and is the last of a series of five reports characterizing emissions from conventional combustion sources. The emissions characterization of industrial combustion sources was based on a critical examination of existing data, followed by a modified Level 1 sampling and analysis approach to resolve data gaps. Tests were conducted at 32 external combustion sites. Emissions assessment results indicate that air emissions from these sources represent a potential environmental hazard. Criteria pollutant emissions, except for CO, from most of the source categories tested are environmentally significant. Particulate sulfate emissions from coal- and wood-fired sources and SO3 emissions from two coal-fired sources are also significant. In addition, emissions of several trace elements are of concern: As, Be, Cl, Co, Cr, Fe, K, Li, Na, Ni, P, and Pb from coal-fired external combustion sources; Ni, Cr, P, and V from distillate oil sources; and Cl, Cr, Na, Ni, Si, and V from residual oil sources. Several potentially hazardous POM compounds were tentatively identified in the emissions from solid-fuel-fired sources; however, further study is needed to positively identify the compounds.

Contract GRI-5080-351-0358

The R&D recommendations of this study result from a review of relevant, existing and anticipated federal and state environmental regulations and policies and from an assessment of the impact they may have on industrial gas-fired burners. Environmental considerations for natural gas combustion are almost entirely restricted to oxides of nitrogen. Federal regulations for NOx emissions from industrial gas-fired boilers require only minimal NOx reduction on some new boilers. More limiting regulations could arise from state PSD and nonattainment permit requirements, which could be significantly changed when the Clean Air Act is reviewed in 1981. California is the only state to enact stringent requirements thus far. Existing and planned California NOx regulations on utility and industrial boilers, refinery process heaters, cement kilns, and glass melting furnaces may require the most advanced control techniques. Development and field demonstrations of both conventional and catalytic low-NOx burners for these applications are of the highest priority for addressing NOx emission regulations in California and best prepare the industrial gas user for future regulations in other states or at the national level. R&D activities related to selective catalytic reduction, acid rain, and NO2 health effects are also recommended.

Project Da Vinci: A Study of Long-Range Air Pollution Using a Balloon-Borne Lagrangian Measurement Platform. Volume I. Overview and Data Analysis. Final Report.
B. D. Zak. May 81, 314p
Contract AC04-76DP00789

Over the past decade, it has become clear that long-range air pollution is important over time and distance scales of days and hundreds of kilometers. With increasing reliance on coal, the problem is expected to become more severe. Project Da Vinci made use of a manned, instrumented balloon system to study long-range transport and transformation of air pollutants on these time and distance scales in a frame of reference moving with the polluted air. Results are reported here for the feasibility experiment conducted in 1974, and for the long-range air pollution studies launched from St. Louis during the summer of 1976. Among the most important results are measurements of the conversion rates of sulfur dioxide to sulfate in dilute power plant plumes mixed with the urban plume far downwind of the sources, and observations of the impact of nocturnal winds aloft on long-range transport. The project was a collaborative effort involving researchers from twenty-six organizations. An overview and data analysis are presented in this, the first of three volumes. (ERA citation 06:024137)

Contract W-7405-ENG-48
NATO advanced research institute on the effects of solar ultraviolet radiation on marine ecosystems, Copenhagen, Denmark, 28 Jul 1980.

In order to assess the potential impact of proposed perturbations on stratospheric ozone, mathematical models were developed to handle the complex coupling between chemical, radiative, and dynamical processes. Basic concepts in stratospheric modeling are reviewed. Of the proposed atmospheric perturbations shown to have a potentially significant effect on stratospheric ozone, chlorofluorocarbons (CFC) present the most significant threat (the estimated change in total ozone being about - 9% at steady state for continued CFC release at the current rate). Two-dimensional model calculations indicate that the largest decreases in ozone would likely occur at high latitudes in winter or spring. Oxides of nitrogen (NO, NO sub 2 , and N sub 2 O) can have a significant impact on ozone. Estimated 1990 aircraft fleet emissions are computed to lead to an increase of total ozone of 1.3%. The models are sensitive to increases in N sub 2 O, but this species is not projected to increase significantly over the next few decades. A doubling of CO sub 2 might lead to an increase in total ozone of about 6%, which would tend to offset the effect of a CFC perturbation. The decrease in ozone estimated to occur over the next several decades would be strongly dominated by the CFC perturbation because of the difference in the projected rates of increase of CFC's and CO sub 2 in the stratosphere. Although stratospheric models have been successful in diagnostic applications, significant uncertainties remain concerning their accuracy for prognostic applications. Uncertainties in chemical rate coefficients contribute most significantly to the uncertainty in model results. In spite of these uncertainties, there is good agreement between independent model predictions. (ERA citation 06:024140)

Study of a Proprietary Pozzolanic Product.
Final rept.,
Alan D. Buck. May 81, 11p Rept nos. WES/MP/SL-81-8, ONWI-249
Contract DE-AI97-81ET46633

Petrographic examination and limited chemical analysis were used to identify constituents in a proprietary 'anti-corrosion' admixture (AD-644) for concrete. Petrographic examination included X-ray diffraction, light microscopy, and scanning electron microscopy. The CaO content of the sample was determined by chemical analysis as a basis for estimating cement content of the sample. The results indicated that the admixture was largely silica fume containing about 12 percent portland cement and a small amount of organic material which was believed to be a water-reducing admixture. Properties of a known silica fume (AD-536(2)) were used as a basis for concluding that silica fume was the principal constituent of this admixture (AD-644).

Solidification Behavior and Microstructural Analysis of Austenitic Stainless Steel Laser Welds.
S. A. DaVid, and J. M. Vitek. 1981, 8p
Contract W-7405-ENG-26
110. annual meeting of the AIME, Chicago, IL, USA, 22 Feb 1981.

Solidification behavior of austenitic stainless steel laser welds has been investigated with a high-power laser system. The welds were made at speeds ranging from 13 to 60 mm/s. The welds sowed a wide variety of microstructural features. The ferrite content in the 13-mm/s weld varied from less than 1% at the root of the weld to about 10% at the crown. The duplex structure at the crown of the weld was much finer than the one observed in conventional weld metal. However, the welds made at 25 and 60 mm/s contained an austenitic structure with less than 1% ferrite throughout the weld. Microstructural analysis of these welds used optical microscopy, transmission electron microscopy, and analytical electron microscopy. The austenitic stainless steel welds were free of any cracking, and the results are explained in terms of the rapid solidification conditions during laser welding. (ERA citation 06:023899)

CSM-3.2.2: Characterizing and Improving the Toughness of Thick-Sectioned 2-1/4 Cr-1Mo Electroslag Weldments.
G. R. Edwards, and R. H. Frost. 1980, 29p
Contract AS05-78ET12313

The electroslag welding process produces large single pass welds by consuming a wire electrode in an ohmically heated flux pool. The process has been particularly appealing for thick-section welding because of its high deposition rate. The welding potential and electrode velocity control the deposition rate, heat input, and thermal history of the heat affected zone. The electrode polarity, current density, and flux and metal compositions control electrochemical reactions which have a dominant influence on the weld metal chemistry. The post weld heat treatment strongly affects the final mechanical properties of the weldment, especially in 2-1/4 Cr-1Mo steel. The objective of this program is to characterize the effects of process variables, chemical variables, and post weld heat treatment, and to apply straight-foreword metallurgical knowledge in optimizing the properties of 4-inch thick 2-1/4 Cr-1Mo steel electroslag weldments. (ERA citation 06:023905)

Technical Progress Report for Application of Numerical Simulation Methodology to Automotive Combustion.
Mar 81, 17p
Contract AC04-79ET15397

This report represents the third quarterly technical progress report for a program entitled, Application of Numerical Simulation Methodology to Automotive Combustion. The goal of the program is to develop, validate, demonstrate and apply a numerical simulation methodology for incylinder reactive flows in internal combustion engines. Previous work on this contract involved the initial development and validation of a finite difference based simulation model for time dependent axisymmetric flows which includes: a generalized coordinate system for arbitrary mesh design and treatment of complex and time dependent boundaries; multiple and interacting chemical species; coupled swirl flow velocity component; and two-equation turbulence closure. In its various stages of development, the model has been used to simulate numerous engine-related problems for validation and demonstration purposes. The technical effort during the current reporting period has concentrated on: reactive flow model development, test and parametric study calculations; engine simulation code clean-up, restructuring and documentation; and fuel injection/droplet model development. Results of these studies are discussed. (ERA citation 06:023822)

Also available in set of 8 reports PC$230.00/MF$16.00, PB81-200107.

Every year, each manufacturer of passenger cars, light-duty trucks, motorcycles, or heavy-duty engines submits to EPA an application for certification. In the application, the manufacturer gives a detailed technical description of the vehicles or engines he intends to market during the upcoming model year. These engineering data include explanations and/or drawings which describe engine/vehicle parameters such as basic engine design, fuel systems, ignition systems and exhaust and evaporative emission control systems. It also provides information on emission test procedures, service accumulation procedures, fuels to be used, and proposed maintenance requirements to be followed during testing. Section 16 of the application contains the results of emission testing, a statement of compliance to the regulations, production engine parameters, and a Summary Sheet Input Form on which issuance of a Certificate of Conformity is based.

Light Truck Side Structure Evaluation. Volume I: Overview and Conclusions.
Final rept. Jun 80-Feb 81,
Michael W. Monk, and Donald Willke. Feb 81, 87p DOT-HS-805 835, SRL-26-VOL-1
See also Volume 2, PB81-210841.

A study was conducted to compare the side structural components of three lightweight pickup trucks with those of a VW Rabbit Sedan. Under previous Agency contracts, a series of side structural modifications had been performed on the sedan resulting in improved compartment integrity. It was desired to know if the same types of structural modifications would be applicable to the lightweight pickup trucks. The pickup trucks selected were: 1978 Chevrolet Luv, 1978 Ford Courier, and 1980 VW Rabbit Pickup. The occupant seating position is documented for each vehicle. The main structural elements are documented and compared. Finally the applicability of the proposed upgrade of Federal Motor Vehicle Safety Standard No. 214 'Side Impact Protection' is discussed.

Crash Tests of Sharply Curved Light-Post Guiderail.
Research rept.,
James E. Bryden, and Kenneth C. Hahn. Jul 80, 36p RR-83, FHWA/NY/RR-80/83
See also report dated Jun 80, PB80-213721.

Cables, W-beam, and box-beam guiderail on S 3x5.7 posts were crash tested on 50- and 100-ft radius curves. Head-on impacts on these sharply curved barriers produced much different results than standard angled impacts on tangent barriers. For the cable and W-beam barriers, deflections were much greater than for standard impacts, but decelerations remained low. For box-beam, deflections increased only slightly, but decelerations were greater.

A Survey Among Lorry Drivers About the Striking of Low Bridges,
Margaret Galer. c1981, 24p TRRL-SUPPLEMENTARY-633
Also pub. as ISSN-0305-1315.

An interview survey of 497 drivers of high vehicles was conducted in 1978. Lorry drivers' knowledge of the overall height of the vehicle plus any load being carried at the time was compared with actual height measurements. Although 95 percent of drivers interviewed claimed to know the height of their vehicles, only 185 drivers were accurate to within 3 in. either side of the correct height and 73 drivers were underestimating their vehicles' height by more than 3 in. Lorry drivers' knowledge of road signs relating to low bridges was also investigated. Seventy-two percent of lorry drivers were fully or acceptably correct in their understanding of the road sign 'Headroom at hazard ahead', but only 31 per cent were correct in their understanding of the road sign 'Available width of headroom at hazard'. EPA Evaluation of the Gastell Device Under Section 511 of the Motor Vehicle Information and Cost Savings Act.
Technical rept.,
Edward Anthony Barth. Feb 81, 123p EPA-AA-TEB-511-81-8

This document announces the conclusions of the EPA evaluation of the 'Gastell' device under provisions of section 511 of the Motor Vehicle Information and Cost Savings Act. On November 11, 1979, the EPA received a request from Automotive Devices, Inc. for evaluation of a fuel saving device termed 'Gastell'. This device is designed to provide the vehicle operator visual and audible indications of inefficient engine operating conditions so

that the fuel-conscious drivers can modify their driving habits to obtain improved efficiency. An evaluation has been made and the results are described in this report.

This report presents evaluation summaries of 27 priority treatment projects for high occupancy vehicles (HOV's). The projects evaluated consist of contraflow; concurrent flow and physically separated HOV lane treatments on both grade separated and surface street facilities. In addition, priority HOV ramps, bus signal preemption, priority HOV parking facilities and toll pricing strategies are covered. The evaluations include project descriptions, locations and characteristics plus presentations of key project impacts. Summary tables and discussions compare these findings with updated characteristics and impacts of 14 additional projects evaluated in an earlier study document, Priority Treatment for High Occupancy Vehicles: Project Status Report (March 1977). A detailed bibliography is cross-referenced to each project. These results provide a base from which to evaluate ongoing and future HOV priority treatments.

Side Impact Sled and Padding Development.
Final rept. Jun 79-Feb 81,
Michael W. Monk, and Lisa K. Sullivan. Feb 81, 288p SRL-17, DOT-HS-805-889

A study was conducted to devise and fabricate a HYGE sled buck which could be used to simulate oblique side impact collisions. Once completed the buck was demonstrated by simulating the occupant and side door interactions of two separate laboratory car-to-car impacts. The degree of success of these two simulations is discussed. Following the simulations, the sled buck was used to select padding materials which appeared promising for occupant protection in side impact collisions. The selection criteria and results are presented.

The Automated Guideway Transit Technology (AGTT) program is a comprehensive, critical technology development program, and it is oriented toward the development of systems analyses and system elements that may be used in advanced urban transportation systems. The Vehicle Longitudinal Control and Reliability (VLCR) project is vital to the AGTT program; it aims to provide the basis for improving the effectiveness of future AGT systems and for insuring that the best VLCR approaches are identified, documented, and demonstrated. The project emphasizes the improvement of the performance of longitudinal control subsystems. The project involved the development, design, and demonstration of a moving-block longitudinal control system; the development of techniques for reliability enhancement; and a study of automatic entrainment and platooning concepts. The final report of the VLCR project consists of 8 separate volumes. This volume, the Project Summary, provides an overview of the entire VLCR project and presents the significant findings and achievements. The detail analysis and design results are fully described in each of the volumes of the final report. This volume contains all the salient information including the goals and objectives, evaluation of existing technology, major results and achievements, discussion of promising concepts, descriptions of the major features of the test program, and a commentary on the project results.

EPA Evaluation of the Gas Meiser I Under Section 511 of the Motor Vehicle Information and Cost Savings Act.
Technical rept.,
Edward Anthony Barth. May 81, 21p EPA-AA-TEB-511-81-1

This document announces the conclusions of the EPA evaluation of the 'Gas Meiser I' device under provisions of section 511 of the Motor Vehicle Information and Cost Savings Act. On December 17, 1980, the EPA received a request from Gas Meiser I. This device is claimed to '. . .increase fuel economy by pre-heating the fuel.' The device consists principally of a gasoline hose wrapped around the vehicles's upper radiator hose.

A Study of the Effectiveness of Mechanic Training for Vehicle Emissions Inspection and Maintenance Programs.
Technical rept.,
R. Bruce Michael. Apr 81, 35p EPA-AA-IMS-81-11

This report describes a study to determine if a short, practical training course for emissions repairs has a supplementary emission reduction and fuel economy benefit to an inspection and maintenance program. The study was performed in the early part of 1980 in Portland, Oregon. Two matched samples of 21 vehicles each were sent to ten repair facilities before and after the facilities received training. The experiment was blind in that the ten repair facilities did not know that the study was in progress or that the 42 vehicles were in any way connected with EPA. The training course used was a 16 hour course in repairing vehicles which fail an idle emissions test. Vehicles were tested before and after repairs on the Federal Test Procedure and various short tests for emissions and fuel economy. Contractor laboratory personnel then attempted to restore the vehicles to their specifications and vehicles were retested.

Multipiece Rims for Trucks, Buses, and Trailers-Economic Effects Caused by Further Regulation of Rims in Standard No. 120.
Final rept. Feb-Aug 80,
R. W. Gaines. 6 Feb 81, 128p DOT-HS-805 902
Contract DOT-HS-9-02111

Data gathered over an extended period of time indicate that multipiece truck and bus wheel rims have caused accidents resulting in injury and death. This study was carried out for the NHTSA to determine the potential cost effectiveness that would result should the use of multipiece rims be phased out of production by rulemaking action. The study identifies one time conversion costs, added cost to truck users and the feasibility of a 5-10 year phase-out program. These costs are then used to arrive at a cost effectiveness factor in terms of reduction in incident that could occur. The differential incident rate between multipiece rims and single piece wheels plays a key role in establishing the cost effectiveness.

D. N. Wormley, D. Lee, and K-M. Lee. Feb 81, 58p HDL-CR-81-216-1, HDL-80-1
Contract DAAG39-77-C-0216

This study focuses upon the analysis, design and experimental evaluation of a hydraulic servovalve constructed from laminar proportional fluid amplifiers and resistance feedback elements. A servovalve has been developed in which the pressure/flow characteristics can be contoured to match a specific application through appropriate design of the proportional amplifiers and selection of the feedback elements. A set of design equations have been derived to select the appropriate feedback elements. From the design procedures, two valve configurations have been constructed and tested. Experimental evaluations of the two configurations in terms of static pressure and flow gains and dynamic response have agreed closely with analyses. (Author)

Evaluation of Laser Welding Techniques for Hydrogen Transmission. Final Report, September 1977-November 1979.
J. Mucci. May 80, 85p COO-4355-11
Contract AC02-77ET26214

This program was established to determine the feasibility of laser beam welding as a fabrication method for hydrogen transmission and is a precursor in the effort to systematically provide the technological base necessary for large-scale, economic pipeline transmission of fuel for a hydrogen energy system. The study contributes to the technology base by establishing the effect of conventional weld processes and laser beam welding on the mechanical properties of two classes of steels in an air and high pressure gaseous hydrogen environment. Screening evaluation of the tensile, low-cycle fatigue and fracture toughness properties and metallurgical analyses provide the basis for concluding that laser beam welding of AISI 304L stainless steel and ASTM A106B carbon steel can produce weldments of comparable quality to those produced by gas-tungsten arc and electron beam welding and is at least equally compatible with 13.8 MPa (2000 psig) gaseous hydrogen environment. Noise in Boilerworks: A Survey (Bruit dans les Ateliers de Chaudronnerie: Enquete).
Final rept.,
29 May 80, 45p
Text in French.

The study of noises in boilerworks, carried out under the auspices of the Mechanical Industries Technical Center, Saint-Etienne, reports on the current situation and is based on a detailed letter-questionnaire sent to 2391 enterprises throughout France. The 244 replies, from around sixty departments, represent 10 percent of the enterprises surveyed (or 11,000 workers) and suggests the extent of interest in the subject. One shop in six has noise absorbant walls or roof. The author suggests that improvements are possible in this field. Noisiest machines are metal cutters, grinders, molders. Among the least noisy operations are riveting and heating. Thirty percent of the personnel surveyed complained of noise; 10 percent of the neighborhood personnel complained. Concerning use of individual noise protective devices, there were three equal groups of responses--no protection; 1-10 percent of the workers wore them; a third group, 11-100 percent. A total of twenty-five percent of the responding workers wore them. Forty-six percent of the responding enterprises had either taken anti-noise measures or were to take them. Most frequent measures were use of noise absorbing materials, individual protective devices, and other technological measures.

Grant NSF-DAR79-17090
Color illustrations reproduced in black and white.

The annealing of ion-implantation damage in semiconductors by laser irradiation is optimized by employing a dual wavelength laser source and tailoring the time delay between pulses at the two wavelengths. This takes advantage of the strong temperature dependence of the absorption coefficient for the initially less-strongly absorbed wavelength. A solid-state laser emitting high-intensity pulses at 0.53 millimicrons and 2.06 millimicrons was used in conjunction with an optical fiber delay line to experimentally study the annealing characteristics of an arsenic-implanted silicon solar cell wafer. By varying the length of fiber and varying the delay between pulses of the two wavelengths, it was determined that at 25 nanoseconds delay, the sample surface is preheated by the 0.53 millimicron radiation. These results are in agreement with a theoretical model based on melting and liquid phase epitaxial regrowth. Calculations based on this model are presented.

Department of the Interior, Washington, DC.
Ring Bar Grizzly.
Patent Application,
Allan T. Fisk. Filed 15 Dec 80, 9p PB81-222648, DOCKET/MIN-2997
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The patent application relates to a ring bar grizzly used as a materials handling device to enable the jam-free transfer of loose rocks or other materials at the discharge end of a generally horizontal conveyor. Normally, this ring bar grizzly is used in conjunction with a horizontally fed machine, such as a rotary jaw rock crusher, or simply to affect the horizontal transfer of material from one generally horizontal conveyance to another. Several loosely fitting rings are mounted on a static bar which is located between the conveyor and the crusher and which spans the width of the inlet to the crusher. Jams which would normally take place between the conveyor and the crusher rotor are eliminated because the freely suspended rings support the medium and large size pieces of rock in the feed, allowing them to pass over the transfer point and into the crusher. Fines and undersized rocks are allowed to drop freely through the ring bar grizzly.

Tool Grinding Machine.
Patent,
C. E. Dial. Filed 22 Mar 79, patented 28 Oct 80, 5p PAT-APPL-6-022 895
Supersedes PAT-APPL-6-022 895.
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 $0.50.

The present invention relates to an improved tool grinding mechanism for grinding single point diamond cutting tools to precise roundness and radius specifications. The present invention utilizes a tool holder which is longitudinally displaced with respect to the remainder of the grinding system due to contact of the tool with the grinding surface with this displacement being monitored so that any variation in the grinding of the cutting surface such as caused by crystal orientation or tool thickness may be compensated for during the grinding operation to assure the attainment of the desired cutting tool face specifications. A Simulator Study of Deepwater Port Shiphandling and Navigation Problems in Poor Visibility.
Final rept.,
R. C. Cook, K. L. Marino, and R. B. Cooper. Jan 81, 190p EA-80-U-099, USCG-D-66-80
Contract DOT-CG-944467-A

The study used a ship's bridge simulator to investigate safety of navigation, the effect of navigation displays, and the effect of bridge personnel organization during low visibility approaches of a VLCC to a deepwater port complex. Experienced VLCC masters and mates, some team trained and team organized, performed over 90 simulated approaches to the Louisiana Offshore Oil Port (LOOP) using either radar, radar with added racons in the area an automatic radar plotting aid (ARPA), or an ARPA displaying fairway boundary lines. Three scenarios were examined: a landfall approach, coastwise approach, approach to pick up the mooring master, and a dead reckoning approach with degraded position information. Strategies which were chosen by the masters in their approaches are described in light of their effect on deepwater port safety. Conclusions derived from descriptive and statistical evidence of performance led to recommendations for relocating the mooring master pickup point, providing an anchorage for use by masters, and the placement and implementation of racons within the deepwater port area. Other recommendations advocate the use of special bridge procedures and navigation systems during port approaches, and further research into the effect of traffic separation or advisory schemes on deepwater port safety. Findings suggest that while approaches of VLCCs to an offshore deepwater port under conditions similar to those simulated are not deceptively difficult or inherently unsafe, there are opportunities to mitigate the potential for hazardous navigation and shiphandling problems. Summary in French.

This report collates and reviews the results of an eleven-year project on the icing of fishing trawlers. Initially the factors causing the icing of ships at sea are presented and some aspects of the physics of the icing process are discussed. Some simple icing tests on cylinders of various diameters are described. These were made in an icing wind tunnel and demonstrated the effects of air temperature and cylinder size of the resulting ice formations. Later, a number of possible methods for reducing the icing hazard were tested in the wind tunnel and at an outdoor test rig. Of the methods tested the most effective was an inflatable rubber de-icing blanket. Throughout the project, icing report forms were distributed to vessels operating out of Canadian east coast ports. The data obtained by this means has helped to establish the types of weather systems responsible for icing conditions, the geographical extent of the occurrence of icing, and statistics on the severity of icing encounters in the study area. Appendices present simplified formulae for the droplet collection efficiency of cylinders and rectangular bodies, the derivation of an analytical expression for the rate of ice build-up on fishing trawlers, and a bibliography of ship icing. Calculation of Natural Vibration Frequencies and Transient Response of Partially Submerged, Supercavitating Marine Propellers.
Final rept.,
Richard V. Raetz, and Gordon C. Everstine. Jun 81, 65p Rept no. DTNSRDC-81/051

Procedures are presented whereby natural vibration and transient response analyses of partially submerged, supercavitating marine propellers may be calculated by means of a standard NASTRAN structural analysis program. The use of these procedures was demonstrated by analyses of an existing propeller, for which some experimental data were available. Results were comparable only in a limited way, but peak calculated dynamic stresses were of the same order of magnitude as those observed experimentally, and were apparently more then twice the magnitude of equivalent static stresses. Arctic Alaska and Icebreaking: An Assessment of Future Requirements for the United States Coast Guard.
Master's thesis,
Jeffrey M. Garrett. Mar 81, 189p

Technological advances, increased energy demand, and political events have coalesced in recent years to make the extraction of hydrocarbon energy resources in the arctic attractive. U. S. efforts in this direction have begun on Alaska's North Slope and are poised to expand into offshore areas. These developments could have, particularly in conjunction with marine transportation, a dramatic impact on the U. S. Coast Guard and especially its icebreaking mission. Evaluation of this impact is approached by a background review of the Coast Guard's icebreaking role and historical development in Alaska; and by evaluation of five issues which seem to be primary determinants of the relevant future. These include (1) energy development; (2) energy-related transportation; (3) concerns for the natural and social environment; (4) Canadian arctic developments; and (5) the international perspective. Trends in these five issue areas are then integrated to formulate a projection of future Coast Guard icebreaking requirements in the Alaskan arctic. (Author)

Effect of Bow-Down Trim on the Resistance Characteristics of the AO 177 Hull Represented by Model 5326.
Final rept.,
William G. Day, Jr., and Douglas S. Jenkins. Jun 81, 15p Rept no. DTNSRDC/SPD-0544-16

Experiments were performed with a 1:25.682-scale model of the AO 177 to determine the effect of bow-down trim on the resistance of the hull. The three full-scale trim conditions represented were 1.5-foot (0.46 m) trim by the stern, 1.0-foot (0.3 m) trim by the bow, and 3.5-foot (1.07 m) trim by the bow. The results indicate a small increase in resistance at the 21.5-knot design speed with increasing trim by the bow. (Author)

Singular Perturbation Method for Supercavitating Propellers.
Technical rept. 11 Feb 80-10 Feb 81,
Okitsugu Furuya. 30 Jan 81, 82p Rept no. TETRAT-TC-3369-01
Contract N00014-80-C-0277

The singular perturbation method for the supercavitating propeller had four scaling parameters; (1) span length R, (2) chord length c, (3) blade spacing d and (4) cavity length 1 sub c. The first problem solved here assumed that c/R and 1 sub c/R were of order epsilon but d/R was of order of unity. The nature of the singular perturbation problem for such a case was similar to that for the subcavitating propeller solved by Brockett except for the solution of the inner region. The thrust and torque coefficients were obtained explicitly without solving the integral equations. Since the nonlinear supercavitating flow theory was employed in the present work as the inner solution, there existed no limitation for the flow incidence angles or blade profile shapes and thus the present solution would provide more accurate results than those with the linearized theory. The second problem treated here was the case in which c/R was of order of epsilon but 1 sub c/R and d/R were of order of unity. This was the case having long cavities behind the propeller blades so that even when the chord shrank to a line, the cavities were left behind the lifting lines. This portion of cavity sheets was called 'source sheets', the singularity strengths of which were obtained through the cavity sheet matching, a totally different matching procedure from the regular matching. The first-order inner solution used a closure condition, i.e., the total source term S(O) equal to zero.

Drydock Extension - A 1980 Underwater Technology Survey for Extension of Time between Drydocking.
Final rept. Apr-Dec 80,
F. Matanzo, J. Metcalf, A. Nelson, and R. Renuart. Dec 80, 337p USCG-D-15-81
Contract DTCG23-80-C-20009

The results are presented of a feasibility study to extend the time between drydocking of commercial vessels under U.S. Coast Guard jurisdiction. The existing drydock inspection requirements are documented and then compared to underwater technology. It is demonstrated that with trained divers, underwater closed circuit television, and color photography, the Coast Guard inspector can be provided with the visual information he needs. Problems with water turbidity can be alleviated by careful selection of the sea port and matching the camera and light sources. Use of blanking flanges and listing and tipping of a vessel allow for a complete inspection. Underwater preservation, maintenance, and repair are all possible with existing underwater technology. Contract MA-6-38060
See also PB81-220980.

Phase I of the development of the Next Generation Cargo Liner addressed the commercial trade forecasts and the development of custom ship designs for seven participating owners. Phase II was to prepare a preliminary design of a standard ship which would satisfy a composite of the various owners' requirements. In attempting this it became clear that additional research and development is

needed. Volume I addresses three sizes of vessels ranging from 18,700 DWT to 26,030 DWT and service speeds from 20 to 23 knots. These vessels can accommodate RO/RO, containers, and break-bulk cargo depending on outfitting.

Structural Analysis of the Collapsing Bow of a Striking Ship.
Final rept.,
Pin Yu Chang, and Chirasak Thasanatorn. 28 May 80, 128p TR-8029-1, MA-RD-940-81065
Contract MA80-SAC-01051
Portions of this document are not fully legible.

A mathematical model and structural dynamic computer program have been developed for the analysis of the collapsing bow of a striking ship. The model can be used to predict the collision impact force and the extent of damage of the striking ship bow in both perpendicular and oblique collision. The ice breaker POLAR STAR was used as an example for testing the computer program for an oblique collision angle. The companion report has been released under the title 'Formulas and Procedures for Estimating Collapse Loads of Ship Structural Members,' Report No. MA-RD-940-81066.

Development of a New Concept for Cylindrical Pressure Hulls,
R. H. Knapp, R. T. Kudo, and B. Auksmann. Aug 80, 7p UNIHI-SG-JC-81-05, NOAA-81051107
Grant NOAA-04-6-158-44026
Pub. in Jnl. of Engineering for Industry, v102 n3 p253-257 Aug 80.

The prebuckled cylindrical (PC) shell represents a new structural concept suitable for use in the undersea environment. The externally pressurized PC shell has been shown to be more resistant to buckling failure than a comparable 'true' cylinder. The technical feasibility of this new concept has now been realized by the design and construction of a large-scale prototype made entirely of transparent acrylic plastic. The success of this initial effort offers encouragement to further pursue applications of this novel structural form to other uses in the ocean.

Geotechnical Reliability of Offshore Gravity Platforms,
Gregory B. Baecher, Mark Chan, Thomas S. Ingra, Thomas Lee, and Louis R. Nucci. Dec 80, 298p MITSG-80-20, NOAA-81042708
Grant NOAA-04-7-158-44079

The main part of the report is organized into five broad chapters. The first presents an overview of the sources of geotechnical uncertainty in offshore structures, previous quantitative analysis of those uncertainties, and the philosophy of formal methods in geotechnical reliability analysis. The second and third examine the basic uncertain variables, dealing with environmental loads and load effects, and with site characterization and parameter estimates, respectively. Chapter 5 is an extended discussion of the problem of modeling foundation performance, and the uncertainties of that undertaking. Finally, Chapter 6 considers the aggregation of these uncertainties into overall estimates of risk and reliability. To illustrate the analyses and methods developed in the course of the work, a specific site on the southern flank of Georges Bank has been chosen for discussion. Specific information on the site has been introduced as needed throughout the report.

In-Place Testing of Tandem HEPA Filter Stages Using Fluorescent Aerosols.
J. C. Elder, T. G. Kyle, M. I. Tillery, and H. J. Ettinger. Apr 81, 41p LA-8805-MS
Contract W-7405-ENG-36
Microfiche only after original copies are exhausted.

Fluorescent test aerosols have been incorporated into an in-place two-stage high-efficiency particulate air (HEPA) filter test method to improve sensitivity and eliminate interference by background aerosol leaking into the downstream sampling location. The method has been demonstrated by field testing large two-stage HEPA systems, one with a flow rate of 22 m exp 3 /s (48,500 cfm) and a decontamination factor (DF) of approximately 10 exp 8 . Advantages of the method, such as DF measurement more representative of actual filter performance and potential savings in construction and testing costs, make the fluorescent particle method a useful test method. A laser fluorescent particle spectrometer suitable for testing by this method was developed in conjunction with an instrument manufacturer and is commercially available. An improved dilution system was developed to reduce upstream aerosol concentration into the operating range of the spectrometer. Generation of a fluorescent dye-tagged DOP aerosol was accomplished by high-capacity, gas-thermal generator. Aerosol concentration of approximately 2 x 10 exp 6 particles per cm exp 3 was maintained in the plenum upstream of the first stage. Other in-place test methods using fluorescent particles collected on sampling filters were investigated with only limited success and could not be extended to two-stage testing. The potentially most sensitive method, counting of solid fluorescent particles on sample filters taken upstream and downstream of HEPA filter stages, was restricted by particle losses in the resuspension operation. Maximum DF measurable by a solid fluorescent particle method was predicted to be 3 x 10 exp 3 , which would be adequate for testing one high-quality HEPA filter stage without excessive filter loading. Redesign of Turbine-Pump Impeller and Diffuser Using Hydrodynamic Design Techniques. Final Report.
J. T. Hamrick. Apr 80, 97p ORO-5127-1
Contract AC01-78CS40183

It is indicated that in 1976 the average operating efficiency of well irrigation pumps in the US, including losses in the column pipe and line shaft, was 55.5%, but information is presented to show that losses in a pumping system can be reduced and that it is possible to reach a goal of 82% system efficiency. Hydrodynamic design methods which are used to analyze and modify a commercially available pump are presented. The results of tests with the pump are presented for which delivery losses were reduced by means of a packer at the pump and for which line shaft losses were reduced by means of a high strength line shaft. Methods of designing pumps that have a broader high efficiency range are explored, and a design approach for doing so is presented. The method was not evaluated experimentally. Prototype Lockhopper Valve Testing and Development Project Test Plan.
J. F. Gardner, and T. R. Holtz. Apr 81, 50p
Contract AM21-80MC14522

This document has been prepared to summarize the overall plan for testing and evaluating prototype lockhopper valves being developed by Fairchild Industries, Inc., Stratos Division, and Consolidated Controls Corporation under contract to DOE/METC. The testing effort described herein will be used to establish the capability of these valves to meet the design criteria contained in Lockhopper Valve and System Design Criteria and Guidelines for Coal Conversion and Utilization Applications, DOE/METC/54-138. The design criteria were based on the requirements of the Lockhopper Valve RFP 1813, analysis of those coal conversion processes that are most promising for demonstration and pioneer commercial plants, and a desire for valve life comparable with other plant equipment. The test plan was prepared with inputs from, and in cooperation with, Morgantown Energy Technology Center personnel and is a major revision of Prototype Lockhopper Valve Test Plan, METC/R1-79/5/R2. Pipeline Accident Report - The Pipelines of Puerto Rico, Inc., Petroleum Products Pipeline Rupture and Fire, Bayamon, Puerto Rico, January 30, 1980.
19 Dec 80, 69p NTBS-PAR-80-6

At 9:50 a.m., on January 30, 1980, an 8-inch-diameter, refined petroleum products pipeline owned by the Pipelines of Puerto Rico, Inc., and operated by the Shell Oil Company (Puerto Rico) Ltd. was struck and ruptured by a bulldozer during maintenance work on a nearby waterline in the Sector Cana of Bayamon, Puerto Rico, about 10 miles southwest of San Juan. Gasoline from the rupture sprayed downhill and ran off into a small creek. About 1 1/2 hours later, the gasoline vapors were ignited by an undetermined source and exploded; the subsequent fire killed one person and extensively damaged 25 houses and other property. The National Tranportation Safety Board determins that the probable cause of the accident was the rupture of the pipeline by a bulldozer, whose operator was unaware of the pipeline's precise depth and location, and the failure of the Aqueduct and Sewer Authority and the Highway Authority personnel at the accident site to ascertain the exact location of the pipeline and to take proper precautions. Contributing factors in the accident were the lack of visible aboveground temporary markers to show the exact location where the pipeline crossed under the waterline, and the use of heavy construction equipment near the pipeline while the pipeline company inspector was absent.

Pipeline Accident Report - Union Light, Heat and Power Company, Natural Gas Explosion and Fire, Simon Kenton High School, Independence, Kentucky, October 9, 1980.
28 Apr 81, 40p NTSB-PAR-81-1

About 11:55 a.m., on October 9, 1980, a 2-inch-diameter compression coupling located on the upstream side of a gas meter set assembly in the boilerroom of the Simon Kenton High School in Independence, Kentucky, pulled out of its connection with a 2-inch-diameter gas service line. Natural gas at 165-psig pressure escaped through the 2-inch-diameter opening and, seconds later, exploded and burned. A basement wall was blown down, an adjacent classroom was damaged, and one student was killed. About 30 minutes later, a second explosion occurred which injured 37 persons and extensively damaged the school. The gas service line was connected to a 4-inch-diameter gas main owned by the Union Light, Heat and Power Company, which was uprating the gas main by controlled pressure increases at the time of the accident.

Motor Vehicle Collisions with Trees Along Highways, Roads, and Streets: An Assessment.
Special study.
13 May 81, 74p NTSB-HSS-81-1

The National Transportation Safety Board has studied extensive data collected regarding vehicle collisions with trees, has investigated 19 accidents involving trees, and as a result has determined certain characteristics of such collisions. In addition, the Safety Board reviewed information supplied by seven States regarding accident data, roadside obstacle programs, and tree removal or protection programs. About 3,280 fatalities resulting from vehicle collisions with trees occur annually in the United States. NCSS data showed that vehicle accidents with trees are more severe than other frontal collisions and that when passengers fail to use restraints, fatalities may occur at speeds as low as 16 to 20 mph. The Safety Board found that few projects exist to remove or protect roadside trees, and that minimal delineation or warning signs existed at some of the accident locations. To reduce the number and severity of vehicle collisions with trees, the Safety Board has recommended implementing programs to warn motorists of the changes in roadway alignment and to protect or selectively remove roadside trees.

Vehicular Impact Tests of a Truck Mounted Attenuator Containing Vermiculite Concrete Cells.
Final rept.,
R. L. Stoughton, J. R. Stoker, and E. F. Nordlin. Jun 80, 156p 609936, FHWA/CA/TL-80/26

Six vehicular impact tests were conducted. Cars ranging in weight from 1890 lbs to 4480 lbs impacted the rear end of dump trucks at speeds of 45 mph. In five of the tests truck mounted attenuators (TMA's) were used on the trucks. The TMA tested was a 6 ft-0 in. long by 8 ft-0 in. wide by 2 ft-0 in. high plywood box enclosing 84 crushable vermiculite concrete cells arranged in a designed pattern. The tests were intended to study (1) the effectiveness of the TMA in reducing car and truck damage and decelerations, (2) the vehicle trajectories after impact and specifically the roll ahead distance of the trucks using different truck braking conditions, and (3) other characteristics of the TMA's such as ease of use, amount of debris after impacts, durability, etc.

Pedal Cycle Conspicuity.
Technical rept.,
W. H. J. Sator. Oct 79, 41p RV/1/79

Local and overseas research has shown that a lack of rear conspicuity in pedal cycles plays a major role in serious accidents involving these vehicles. The results of a survey showed that almost all pedal cycles on South Africa roads were not conspicuous at a 'safe distance' from the rear at night. This was mostly due to inadequate rear retro-reflectors. A large proportion of these retro-reflectors are imported and do not comply with the Road Traffic regulations. Experiments were conducted to establish the reflective value of an effective retro-reflector. Recommendations are made for increasing pedal cycle conspicuity.

Pedestrian Fatalities: A Comparison of Experience in the United States of America and in South Africa during the Year 1976-1978.
Technical rept.,
J. O'Day, and H. B. Pretorius. Sep 79, 16p RY/9/79

The co-author of this report, H. B. Pretorius of this Institute, visited the Highway Safety Research Institute of the University of Michigan (HSRI) in the USA for the period 1 July 1979 to 4 September 1979. In collaboration with Mr. J. O'Day, Head of System Analysis (HSRI) he compared the pedestrian fatalities of the USA and SA with respect to age groups VS hour of the day. It is observed that in both countries one particular problem area is accidents involving 5 and 6 year old children after school. The reason for the differences between the other groups is not clear but differences in the environment and weather may be a major factor.

Bicyclists' Inclination and Ability to Search Behind Before Turning Left.
Interim rept. Nov 79-Jul 80,
S. M. Casey, K. D. Cross, W. A. Leaf, and R. D. Blomberg. Feb 80, 127p DOT-HS-805-893
Contract DOT-HS-7-01726
Also pub. as Anacapa Sciences, Inc., Santa Barbara, CA. Rept. no. AS-TR-373-1.

Research has identified a relatively high incidence (8.4%) bicycle/motor-vehicle accident type in which a bicyclist initiates a left-hand turn without searching to the rear or signaling and is struck by an overtaking motor vehicle. In order to consider countermeasures to this accident type, it was necessary to understand the frequency with which bicyclists actually search behind before turning left, and to determine the ability of bicyclists to maintain lateral stability when looking behind. Hence, two separate studies were conducted. The first, a field-observation study, was performed to assess the frequency with which bicyclists search behind before initiating a left-hand turn. The second experiment measured the magnitude of the inadvertent lateral deviations that accompany a rearward search as a function of the bicyclist's age and riding experience.

Contract DOT-FH-11-9385
See also PB81-217747, Volume 2.

The report describes a series of experiments that were conducted to examine the effectiveness of four-way flashers. Both the disabled vehicle situation and the slow-moving vehicle situation were examined at two- and four-lane locations under both daylight and nighttime conditions. The disabled vehicle tests involved parking a test vehicle (either a car or a tractor-trailer) at the side of the road and monitoring the behavior of drivers. The slow-moving vehicle tests involved introducing a staged slow-moving vehicle (either a car or a tractor-trailer) into the traffic stream and observing the overtaking vehicles. At the disabled vehicle, red and amber four-way flashers as well as flares, reflectorized triangles, headlights, and other situational factors were evaluated. For the slow-moving vehicle tests, the effects of red and amber flashers as well as a 30 and 40 mph (48.3 and 64.4 kph) slow-moving vehicle were examined.

Contract DOT-HS-6-01444

Two model regulations to remove parking--one from suburban streets in daylight hours and one on the last 50 feet of the approach to crosswalks--were designed in previous work to prevent pedestrian dart and dash accidents by removing screening vehicles, therby allowing pedestrians and motorists to more easily see each other and react as needed. To evaluate the safety benefits of the regulations, a study was conducted in New York City. The residential areas of Manhattan have one-side-only parking for three hours per day according to a scheme balanced by time of day and affected side of street. Accident data from 1974-1977 were screened and reports were reviewed. Based on 835 pedestrian accidents, no changes in accident distributions were found when the alternateside parking regulation was in effect. Supplementary observations in the test areas showed good but imperfect compliance with the parking bans and virtually no changes in pedestrian frequency of appearance and gross behaviors as a function of parking changes. The pattern of results plus discrepancies between the New York study situation and the model regulations meant that little could be concluded with respect to the effectiveness or noneffectiveness of the regulations. Guidelines for further research were presented, stressing the need for direct comparability to the model regulations.

Workshop to Review Problem-Behavior Research Programs: Alcohol, Drugs, and Highway Safety.
Final rept. 1978-81,
M. E. Marks, A. C. Donelson, J. R. Treat, R. K. Jones, and K. B. Joscelyn. May 81, 130p UM-HSRI-81-21, DOT-HS-805-908
Contract DOT-HS-8-02031

The report presents the proceedings of a workshop on alcohol, drugs, and highway safety. The purpose of this workshop was to develop specific recommendations for the planning and implementation of NHTSA research, development, and demonstration projects in the program area of Alcohol and Drugs. Workshop participants represented both the practitioner and researcher communities. General issues related to the program area of alcohol and other drugs were discussed, and specific program elements reviewed in-depth. Two working groups participated in a series which dealt with the following topics: General Objectives of the Alcohol and Drugs Problem Identification; Countermeasure Development, Test, and Evaluation; Knowledge Transfer; Demonstration and Other Techniques; and Other Drugs and Other Topics. This report summarizes discussions of these topics. Conclusions about the general objectives of an alcohol and drugs program and recommendations concerning specific program elements concerning the direction of future research in this area are presented.

The Effectiveness of Head Restraints: An Analysis of Texas Data.
Final rept. Oct 80-May 81,
Clayton Best, Donald Whittier, and Jim VanMeter. May 81, 43p DOT-HS-805-907
Contract DTNH-22-80-C-06017

The primary objective of the report was to determine the injury reducing effectiveness of head restraints in rear impact collisions. Three categories of injuries were analyzed from records on the 1972 Texas accident data set. Multi-dimensional contingency table analysis was used to control for the confounding effects of four variables (vehicle damage severity, driver age, driver sex, and vehicle size). In addition, side impact collisions served as a control group to remove any biases in the raw data. The study found significant effectiveness rates in all three categories of injuries after controlling for the presence of confounding effects.

Aircraft Accident Report--Kellogg Company Avions Marcel Dassault Breguet Falcon 10, N253K, Meigs Field, Chicago, Illinois, January 30, 1980.
12 May 81, 25p NTSB-AAR-81-6
Papercopy available on subscription, North American Continant price $50.00; all others write for quote. Issued irregularly.

At 1548:35 c.s.t., on January 30, 1980, a Kellogg Company Falcon 10, N253K, crashed into Lake Michigan just after an attempted takeoff from runway 18 at Meigs Field, Chicago, Illinois. The aircraft came to rest in 25 feet of water about 300 feet from the departure end of the runway. Of the four passengers and two crewmembers aboard, one passenger and one crewmember were killed. The other four persons were injured seriously. The aircraft was destroyed. The National Transportation Safety Board determines that the probable cause of the accident was the flightcrew's failure to release the parking brake before the takeoff roll was started, which resulted in significant wheel/brake drag and a nosedown pitching moment that inhibited the aircraft's capability to effect a normal acceleration and rotation for takeoff. Contributing to the accident was the lack of adequate company checklist procedures to insure the timely release of the parking brakes.

Investigation of Deterioration of Brick in Navigation Lock Control House Structures, Tulsa District.
Final rept.,
Robert H. Denson, G. Sam Wong, and Tony B. Husbands. Sep 80, 58p Rept no. WES/MP/SL-80-14

The deterioration of brick in certain control house structures at five navigation locks was characterized by partial or complete separation of laminations from the face of several bricks. Some of the laminations had fallen completely off. Deteriorated and nondeteriorated samples were removed from several structures and were evaluated by physical testing and petrographic examination. The deterioration mechanism was identified as moisture intrusion accompanied by freezing and thawing. Six model walls were constructed and each was coated with a different protective coating to determine the effectiveness of such treatment. The six coatings were rated in order of efficiency in producing protection with urethane coatings outperforming epoxy and silicone coatings. (Author)

Interstitial Space in Health Facilities: An Investigation and Report on the Application of the Interstitial Space Concept to Health Care Facilities.
Research study rept.
Jan 79, 329p

Interstitial space is defined, for purposes of this study, as a fully accessible walk-through space at least two metres (6'-6") in height beneath a framed floor structure and above the ceiling below, devoted to the distribution of mechanical and electrical services, reducig the need for access from (and consequent disruption to) the uninvolved occupied rooms below for purposes of alterations and repairs. The purpose of the study is to indicate a methodology for prospective building owners and designers to assist in determining whether or not to incorporate interstitial spaces in the design of a specific building.

Contract W-7405-ENG-48
Conference on thermal performance of the exterior envelopes of buildings, Orlando, FL, USA, 3 Dec 1979.

Interest in conserving energy is motivating homeowners and builders to reduce natural infiltration to very low levels. This large reduction in ventilation can lead to indoor moisture problems and, more importantly in terms of human health, increased levels of indoor pollutants such as nitrogen dioxide, formaldehyde, and radon. This paper reports residential air-quality measurements conducted by LBL and, specifically, discusses the use of mechanical ventilation systems with air-to-air heat exchangers as a promising means of pollutant control. A particular advantage of this control strategy is that the heat exchanger permits recovery of a large portion of the heat that would normally be lost in a simple exhaust ventilation system, and therefore maintains the energy efficiency of the house. An economic analysis is presented showing that installation of these systems in newly constructed homes is cost-effective in most regions of the country. (ERA citation 05:032440)

Fire Safety in Buildings: Needs and Criteria (La Securite des Batiments Contre L'Incendie: Besoins et Criteres).
Final rept.
1977, 235p CIB/PUB-48
Text in French and English.

This symposium took place under the auspices of the Conseil International du Batiment (CIB), a nongovernmental organization, which promotes international collaboration in research into buildings and their environment. Those taking part in this collective effort included public and private research bodies, professional association, industries and enterprises, and working commissions of specialists from different national institutes undertake international research and study projects. One such is the Fire Commission (CIB-W14) which is working on problems related to fire safety in buildings. Through this symposium, W14 can foster international discussion of the fire problems to which many separate organizations and countries are paying increasing attention. Very roughly, the technical fire problem is how to design or specify a product or fire protection system to meet certain safety requirements of consumers, insurers, manu-

facturers or governments ets. For these purposes research concentrates on the behaviour of fire and the behaviour in a fire of materials, products, components etc.

Principles of Fire Safety in Buildings.
c1978, 59p CIB/PUB-41

The problem of providing safety from fire in buildings is attracting more and more attention nationally and internationally as new materials and designs pose new problems to the engineer and designer and to the authorities responsible for safety. This guidance note, while not referring to all matters which might affect life and property loss in fire, has been prepared by CIB Working Commission W14, Fire, for people who are not specialists in fire matters but who may be confronted with a particular problem of design or equipment, and who wish to see it in a wider context. A bibliography is provided for further reading of special or more detailed aspects of some of these topics.

Compendium of Working Commissions and Steering Groups.
22 Jan 81, 139p

The latest edition of the Compendium of CIB Working Commissions and Steering Groups has been compiled on the basis of information available to the General Secretariat as per January 1981. It updates the previous edition issued in 1974. While every effort has naturally been made to ensure the accuracy of the information contained, for certain practical reasons the lists of members accompanying each entry may not always be the most up to date. The data given in this Compendium clearly demonstrate that it is within the Working Commissions and Steering Groups that the main thrust of CIB's activities lies and reference to the list of contents will show the varied directions which these activities take. Working Commissions are established in those fields in which a present or future need is identified for common scientific study of potential benefit. Steering Groups, on the other hand, are set up on practical criteria to execute specific tasks as for example, the organization of a Symposium where the principal aim is the exchange and transmission of knowledge.

Research on Maintenance and Modernization, Working Commission W70: Proceedings of the Rotterdam Seminar, 25-27 September 1979.
c1980, 231p CIB/PUB-54

These Proceedings are the result of a researchers' seminar organized by Working Commission W70-Maintenance and Modernization, held in Rotterdam from 25 to 27 September 1979. The seminar's main objective was to widen information exchange between researchers in different countries and see what measures C1B/W70 should take to enable research to be effectively used for solving maintenance and modernization problems. At the seminar a series of lectures on maintenance and modernization research was presented, together with a presentation of the results of the questionnaire. The seminar was closed with a discussion about future work within W70. A paper written by the coordinator provided the foundation for discussion. The papers are included in these proceedings, together with a summary of the related discussion. As far as a presentation at the seminar varied from the corresponding paper, an outline of that presentation is given too. Besides that, some of the authors have written a revised version of their paper for this publication, incorporating parts of their presentation at the seminar.

International Recommendations for Masonry Structures.
1980, 102p CIB/PUB-58

The present recommendations are part of a set of 6 volumes forming an International System of Technical Recommendations for the Design and Execution of structures. The aim of this set of volumes is to give a common basis for the designer and the builder of structures and to allow different countries to draw on them in drafting national standards. The present volume is based on volume I as far as the general principles for the safety and the control of structures, independent of the basic materials (concrete, steel masonry or timber) are concerned. Anything mentioned in the present volume is specifically applicable to masonry. These recommendations are specially intended for the use of code-drafters but where desired may be used by individuals.

Y. K. Wen, and H. T. Pearce. Mar 81, 81p
Structural research ser-489, UILU-ENG-81-2002
Grant NSF-CME79-18053

Stochastic models for dependent loads and load effects are developed. The effects of stochastic dependencies on load combination and structural reliability are investigated in the context of summation of pulse processes in which occurrence time, intensity and duration are allowed to be correlated within each process and between processes. Approximate analytical solutions based on a load coincidence method are obtained and verified by Monte-Carlo simulations. It is found that while within load positive correlations may generally have only moderate effect on the combined load probability, between-load dependencies may be dominant factors and significantly increase the probability of threshold level being exceeded by the combined load.

Racking Tests of Non-Structural Building Partitions (The Behavior of Architectural (Non-Structural) Building Components During Earthquakes).
Final technical rept.,
Satwant S. Rihal. Dec 80, 114p ARCE-R80-1, NSF/RA-800526
Grant NSF-PFR78-23085

The effects of inter-story displacement (drift) during earthquake-like conditions are reported. A series of experiments were conducted (1) to study the correlation between inter-story relative displacement and building partition behavior under horizontal racking loads; (2) to assess the threshold levels of partition damage during horizontal racking actions; and (3) to determine the fundamental characteristics of non-structural building partitions (stiffness and energy absorption capacity and strength) under horizontal racking actions simulating earthquake motion. Parameters in this study consist of geometry of partition configuration and placement of gypsum wallboard panels. Development of the testing program is described and test results, sources of error, and future research plans are presented. Included in the appendices are drawings of test frame and partition test specimens, results of racking tests, and photographs.

The Automated DC Parameter Testing of GaAs MESFETs Using the Singer Automatic Integrated Circuit Test System.
Master's thesis,
Thomas L. Harper. Sep 80, 253p Rept no. AFIT/EE/GE/80-7

Procedures were developed to automate the manual testing of the DC parameters of GaAs MESFETs, integrated resistors and Schottky diodes. These devices are elements of a NAND/NOR logic circuit developed by Hewlett-Packard. The Singer Automatic Integrated Circuit Test System located at the Air Force Wright Aeronautical Laboratories, Avionics Laboratory (AFWAL/AADE), Wright-Patterson AFB, OH, was used to develop these procedures. The system was built by Singer Aerospace and Marine Systems, Glendale, California to test the DC parameters of semiconductor devices using Singer's Elucidate programming test language. The following DC parameters for the above devices were to be tested using the Singer tester: drain-to-source voltage (V sub DS), saturated drain current (I sub DSS) with gate-to-source voltage (V sub GS) at 0.0 volts, linear on-resistance and saturation resistance at V sub GS = 0.0 volts, pinch-off voltage (V sub P), transconductance (g sub M), breakdown voltage (BV)L at V sub GS = 0.0 volts, diode forward and reverse threshold voltages, and resistance. Test results have been obtained for the following MESFET parameters: V sub DS, I sub DSS, V sub GS, linear on-resistance and saturation resistance, V sub P and g sub M. Unfortunately, due to system measurement inaccuracies, these results do not compare favorably when compared iwth curve tracer I-V curves of the MESFETS.

Programmed Control of Optical Grating Scales for Visual Research.
Master's thesis,
Kenneth L. Martindale. Dec 80, 61p Rept no. AFIT/GE/EE/80D-29

This report documents the design of a microprocessor based device which controls the brightness and contrast levels of video signals to be used by scientists in vision research to control laboratory monitors. Contrast control in a standard CRT monitor is obtained through the use of a commercial video chip linear circuit, and brightness control via a straight forward transistor amplifier. The transistor is inserted into the monitor's existing manual control circuit. The linear circuit and transistor are regulated by the microprocessor through digital-to-analog converters. A feedback network reports the actual brightness and contrast produced on the monitor's screen. This network is comprised of a 1024 element photodiode array and an analog-to-digital converter. The photodiode array measures the luminance directly off the monitor and the analog-to-digital converter digitizes the information for use by the microprocessor. The report also contains the results of an investigation into the use of digitally generated video and color monitors for vision research.

A New Instrument for Time-Resolved Reduction of Scattered Radiation in Fluorescence Measurements.
Interim technical rept.,
R. E. Russo, and G. M. Hieftje. 1 Jul 81, 20p Rept nos. TR-39, 47
Contract N00014-76-C-0838

An opto-electronic cross-correlation system was employed to reduce the scattering influence in fluorescence measurements. A stable optical delay line incorporated into the instrument was positioned to yield detection at a fixed time after excitation; the optimal delay time was determined simply from the ratio of the fluorescence decay curve to a similar curve portraying scattering response. Signal-to-scattering background enhancements greater than two were measured for the very short-lived (TAU-0.07 ns) fluorophores whereas a six-fold increase was measured for longer lifetime fluorophores. The shortest lifetime which would benefit from time-resolution in this system is limited by the time-response of the PMT (1.1 ns FWHM); the excitation pulses are on the order of 6 ps. (Author)

Ultrasonic Transducer Performance Requirements.
Final engineering rept. Oct 78-Jun 81 on Phase 2,
Hegeon Kwun, Garry L. Burkhardt, and Cecil M. Teller. Jun 81, 130p
Contract F41609-78-C-1823

Characteristic ultrasonic transducer parameters were measured for over one hundred sixty contact type ultrasonic transducers (of equivalent sizes) used by depot and field NDI shops in the Air Force. For each transducer, a maximum of twenty-four parameters was obtained which included electrical impedance, rf-echo and frequency spectrum, beam characteristics, sensitivity, and signal-to-noise ratio parameters. Transducers were categorized into six groups according to their nominal frequency and beam angle (i.e. 5 MHz and 10 MHz; 0 deg, 45 deg, and 60 deg). Except for 10 MHz-60 deg transducers, thirty-two transducers were evaluated for each category. For measurement of the beam characteristic parameters of the contact transducers, a side-drilled hole block and an automated data acquisition system were developed. Three small fatigue cracks of different sizes were used for the measurement of flaw signal-to-noise ratios (which determine the flaw detectability of a transducer). Wide variations were observed in the characteristic parameters for individual ultrasonic transducers having the same name-plate size, frequency and angle. However, the average performance for all transducers evaluated in each category of transducers was found consistent with theory. In order to find the characteristic parameters which primarily determine the flaw detectability of a transducer, a linear correlation analysis between pairs of parameters was conducted for each transducer category.

Evaluation of Moire Techniques for Wind Tunnel Metrology.
Interim Report, 4 Jan. - 30 Jun. 1981.
J. S. Harris, and K. G. Harding. Jun 81, 17p
NASA-CR-164477
Contract NAG1-143

The development of a moire technique suitable for the analysis of object deflections in a cryogenically cooled, transonic wind tunnel is described. The operating environment for the wind tunnel has a temperature range of 77 to 3390 k, pressure to 91390 Kgs/sq m, and noise to 150 dB SPL. Efforts were made to accomplish the following: to demonstrate projection moire as it would be used to study structural deflections; to use optical processing to multiply the sensitivity of the moire; and to investigate a system design based on the requirements of the wind tunnel geometry.

Measurements of Temperature and Pressure Fluctuations in the T Prime 2 Cryogenic Wind Tunnel.
A. Blanchard, J. B. Dor, and J. F. Breil. Oct 80, 48p NASA-TM-75408
Contract NASW-3199
Transl. Into English of "Mesures des Fluctuations de Temperature et de Pression dans la Soufflerie Cryogenique T Prime 2" (Toulouse), OA8/5007 and Derat No. 8,5007 Dn, Jan. 1980 22 p. Transl. By Kanner (Leo) Associates, Redwood City, Calif. Original DOC. Prep. By Centre d'Etudes et de Recherches de Toulouse, France.

Cold wire measurement of temperature fluctuations were made in a DERAT T'2 induction powered cryogenic wind tunnel for 2 types of liquid nitrogen injectors. Thermal turbulence measured in the tranquilization chamber depends to a great extent on the injector used; for fine spray of nitrogen drops, this level of turbulence seemed completely acceptable. Fluctuations in static pressure taken from the walls of the vein by Kulite sensors showed that there was no increase in aerodynamic noise during cryogenic gusts.

Development of Orthotropic Birefringent Materials for Photoelastic Stress Analysis.
Final Report, Sep. 1978 - Nov. 1980.
I. M. Daniel, T. Niiro, and G. M. Koller. May 81, 79p NASA-CR-165709, IITRI-M06044
Contract NAS1-15541

Materials were selected and fabrication procedures developed for orthotropic birefringent materials. An epoxy resin (Maraset 658/558 system) was selected as the matrix material. Fibers obtained from style 3733 glass cloth and type 1062 glass roving were used as reinforcement. Two different fabrication procedures were used. In the first one, layers of unidirectional fibers removed from the glass cloth were stacked, impregnated with resin, bagged and cured in the autoclave at an elevated temperature. In the second procedure, the glass roving was drywound over metal frames, impregnated with resin and cured at room temperature under pressure and vacuum in an autoclave. Unidirectional, angle-ply and quasi-isotropic laminates of two thicknesses and with embedded flaws were fabricated. The matrix and the unidirectional glass/epoxy material were fully characterized. The density, fiber volume ratio, mechanical, and optical properties were determined. The fiber volume ratio was over 0.50. Birefringent properties were in good agreement with predictions based on a stress proportioning concept and also, with one exception, with properties predicted by a finite element analysis.

Report of the Facility Definition Team Spacelab Uv-Optical Telescope Facility.
Dec 75, 109p NASA-CR-166665
Contract NAS5-20936
Original Contains Color Illustrations.

Scientific requirements for the Spacelab Ultraviolet-Optical Telescope (SUOT) facility are presented. Specific programs involving high angular resolution imagery over wide fields, far ultraviolet spectroscopy, precisely calibrated spectrophotometry and spectropolarimetry over a wide wavelength range, and planetary studies, including high resolution synoptic imagery, are recommended. Specifications for the mounting configuration, instruments for the mounting configuration, instrument mounting system, optical parameters, and the pointing and stabilization system are presented. Concepts for the focal plane instruments are defined. The functional requirements of the direct imaging camera, far ultraviolet spectrograph, and the precisely calibrated spectrophotometer are detailed, and the planetary camera concept is outlined. Operational concepts described in detail are: the makeup and functions of shuttle payload crew, extravehicular activity requirements, telescope control and data management, payload operations control room, orbital constraints, and orbital interfaces (stabilization, maneuvering requirements and attitude control, contamination, utilities, and payload weight considerations).

Test Sample Support Assembly.
Patent Application,
Ernest G. Wolff. Filed 29 Nov 79, 26p AD-D008 534/0
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The invention describes a test sample support assembly having its greatest utility in a length measuring device in a temperature controlled environment. The sample support assembly has a main support, a pair of insulating members and a sample support. In one embodiment of this invention the sample support is made of a substantially distortion-free material thereby precisely positioning the sample within the temperature controlled environment. In the other embodiment of this invention the sample support acts as the temperature controlling element. The sample support is adjustably mounted with respect to the main support. This adjustable feature permits corrective movement of the sample support to take place in order to compensate for the undesirable movement of the sample support. (Author)

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A calibrateable light ray scattering reference rod utilized in a light scattering dust monitor. This light ray rod scatters an amount of light equivalent to a given concentration of dust. Adjustability is provided so that several concentrations of dust can be represented. This adjustment is accomplished by moving a threaded opaque slug axially inside the translucent rod.

PAT-APPL-6-237 021 PC **A02**/MF **A01**
Department of the Air Force, Washington, DC.
Halogen Mass Flow Rate Detection System.
Patent Application,
Steven J. Davis. Filed 23 Feb 81, 25p AD-D008 527/4
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

This invention concerns a halogen mass flow rate detection system having an absorption cell through which a halogen entrained inert gas can be passed. An electromagnetic beam of preselected wavelength in the bound-continuum absorption region is passed through the cell while the halogen entrained inert gas is also therein as well as while only an inert gas passes through the cell. By measuring the intensity of the beam passing through the absorption cell, molecular absorption can be utilized for determining the concentration and, therefore, the mass flow rate of the halogen passing through the absorption cell. By incorporating the halogen mass flow rate detection system in an iodine/oxygen chemical laser, for example, the mass flow rate of the iodine into the resonant cavity of the laser can be simply, accurately and reliably ascertained. An Improved System for Measuring Angular Deviation in a Transparency.
Patent Application,
Harry L. Lask. Filed 11 Mar 81, 17p AD-D008 531/6
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

An improved system for measuring absolute angular deviation through transparencies, such as aircraft windscreens, uses an incoherent light source and a target configuration in the form of an apaque slide with a transparent 'L'-shape pattern. The positions of images of the legs of the 'L' passed through the transparency are detected by CCD arrays for measurement of the azimuth and elevation components of angular deviation for each tested point on the transparency, uncontaiminated by lateral displacement errors. (Author)

Low Power Driver for Flux Gate Magnetometer.
Patent Application,
Robert E. Brown. Filed 24 Apr 81, 14p AD-D008 551/4
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A driver circuit for a fluxgate magnetometer has a repetition rate controllable independent of the magnetometer core winding inductances, and a current-ON interval terminated only by core saturation. In this manner, power consumption is greatly reduced as compared to prior magnetometers without sacrificing low-noise operation. Previous drivers operated in a free-running flyback mode at high pulse repetition rates. The present driver reduced the oscillator repetition rate, and power consumption, by the use of a control loop from the flyback oscillator which signals the end of a current pulse as the magnetometer core rebounds from the saturated state. Modification of Optical Instruments for In-Stack Monitoring of Particle Size.
Final rept. Sep 79-Aug 80,
A. L. Wertheimer. Jun 81, 46p EPA-600/2-81-096
Contract EPA-68-02-3253

A light scattering instrument for in-situ measurements of particles in the 0.2 to 20 micrometer diameter size range is described, and field test results are presented. The instrument is a modified version of an earlier prototype. The upper limit of the size response has been extended from 10 to 20 micrometers, and several component and packaging changes have been incorporated to make the unit more suited to stack particulate emission survey applications. The completed instrument was tested at a coal-fired electric power generating facility. During the test a cascade impactor was used as a referee device and both instruments were run side by side in the outlet duct of the electrostatic precipitator. Results show an excellent correlation between the two instruments with regard to the identification of a 1 micrometers diameter peak in the particle size distribution. A second peak around 20 micrometers was defined by the optical instrument, but could not conclusively be confirmed through the impactor data. The optical instrument handled well during the field test.

Data Reduction Techniques for Aerosol Size Distribution Measuring Instruments.
Progress rept.,
Abde Kapadia. Jun 80, 297p PUB-413, ESRL-RTP-481
Grant EPA-R-804600
Doctoral thesis.

Data reduction methods for the electrical aerosol analyzer (EAA) and the diffusion battery+condensation nuclei counter (DB+CNC) are presented. Both the EAA and DB+CNC can be modeled by the Fredholm Integral Equation of the First Kind. Thus, the data reduction methods for both the instruments are similar. The data reduction methods for both the instruments were analyzed with simulated and experimental data. For the EAA, the comparison between the different data reduction methods for the number distribution is excellent. The agreement between the number distribution retrieved by the three data reduction methods for the DB+CNC was found to be good. Finally, it was shown that for large number mean diameters, the response of the diffusion battery does not change significantly with a considerable change in the dispersion parameter, sigma(g). Thus, the resolution of sigma(g) with the diffusion battery is poor.

May 81, 41p NBSIR-81-2234

Microelectronic test patterns NBS-12 and NBS-24 are modular developmental patterns for experimentally evaluating improved designs of certain test structures. NBS-12 addresses geometric design considerations for the cross-bridge sheet resistor test structure. NBS-24 contains a variety of preliminary designs for the integrated gated-diode electrometer and a series of variations on the design of the MOSFET dc profiler. Both patterns also include assorted process parameter test structures. Tables of design parameters, functional descriptions of the test structures in each pattern, and computer-composed outline drawings showing all of the test structures are included.

A Simple Method for Cross-Sectional Examination of Wear Debris Flakes.
Final rept.,
P. J. Blau. 1981, 1p
Pub. in Wear Short Commun. 66, p257-258 1981.

This brief note covers a precedure which can be used for mounting and cross-sectioning thin flakes of metallic wear debris (25-250 micrometers in size). The mounts can be used for metallographic studies of debris structure or for measurements of debris dimensions. The basic procedure involves the use of a glass coverslip sandwich mounted on edge in a standard, room temperature curing epoxy mount.

Computerized Ultrasonic Data Acquisition and Signal Analysis System.
G. H. Thomas, and M. Kelley. May 81, 11p
Contract AC04-76DP00789

Ultrasonic analysis has proven to be a powerful nondestructive evaluation technique. Much of ultrasonics versatility is due to computerization. Computer signal processing and analysis allows the vast quantities of reflector information contained in an ultrasonic echo to be extracted and assimilated. A computerized, ultrasonic nondestructive evaluation facility has been developed at Sandia National Laboratories in Livermore. This report describes the facility and mentions a few of the studies being considered. (ERA citation 06:024034)

Logic Analysis of Complex Systems by Characterizing Failure Phenomena to Achieve Diagnosis and Fault-Isolation.
J. T. Wong, and W. L. Andre. Apr 81, 22p NASA-TM-81291, USAAVRADCOM-TR-81-A-12
Prepared in Cooperation with Army Research and Technology Labs., Moffett Field, Calif. Presented at the Joint Intern. Meeting of Cors and Orsa, Toronto, 3-6 May 1981.

A recent result shows that, for a certain class of systems, the interdependency among the elements of such a system together with the elements constitutes a mathematical structure a partially ordered set. It is called a loop free logic model of the system. On the basis of an intrinsic property of the mathematical structure, a characterization of system component failure in terms of maximal subsets of bad test signals of the system was obtained. Also, as a consequence, information concerning the total number of failure components in the system was deduced. Detailed examples are given to show how to restructure real systems containing loops into loop free models for which the result is applicable.

Reliability Studies of Materials Using Several LSI-11 Based Systems.
K. A. Gertz. 2 Apr 81, 5p CONF-810546-1
Contract W-7405-ENG-48
1981 spring DECUS U.S. symposium, Miami Beach, FL, USA, 18 May 1981.

Valid predictions about the reliability of materials require tests on a large number of samples. The materials must undergo a number of different types of load histories in order to make an accurate definition of the damage function. At LLNL, a test facility was designed that allows material testing of strength and life to be done at the different load histories. The facility uses several LSI-11 microcomputers as multichannel data acquisition systems. Currently, each system operates independently using floppy disks as program and data storage. The floppy disks containing the data are hand carried to a PDP-11/60 minicomputer for data analysis. Each system uses an analog-to-digital (A/D) converter selected to best fit the characteristics of the signal being measured; i.e., a high-speed direct memory access (DMA) A/D for signals with fast rise times, an integrating A/D for signals with an ac component, etc. How the Mechanics of Materials Test Facility is implemented is described. (ERA citation 06:022448)

Vibration Stabilized Image Projection System.
Patent Application,
Harry L. Lask. Filed 3 Mar 81, 10p AD-D008 530/8
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A vibration stabilized image projection system includes a viewing screen supported on a vibratory platform, an image projector supported off the platform in a relatively vibration-free environment for projecting an image toward the screen, and an image stabilizing lens interposed between the projector and screen for providing an optical link between them. The stabilizing lens is supported on the platform for undergoing vibratory movement therewith in X, Y, and/or Z planes and relative to the projector. The lens focuses the image at a stationary position on the screen as the stabilizing lens, screen and platform undergo vibratory movement relative to the projector. (Author)

Revision of report dated 30 Sep 80. See also Volume 2, AD-a101 015.

This study addresses four primary questions: How frequently and in what contexts do the Soviets discuss U.S. ASW capabilities. How have the frequency and nature of Soviet commentaries on the subject changed. What U.S. ASW programs are the particular focus of Soviet commentary. What is the Soviet perception of U.S. anti-submarine warfare capabilities and how has it changed over the period 1960 - 1980. Answers to these and related questions have been derived from qualitative and quantitative content analyses of Soviet open-source national security publications. The commentaries sampled in the analyses - spanning the years 1960 to 1980 - represent the views of naval, military, and party/government leaders and spokesmen. (Author)

Strategic Airlift: U.S. to Europe.
Master's thesis,
Eric Kalei Holck, and Robert W. Ticknor. Mar 81, 119p Rept no. AFIT/GST/OS/81M-7

This thesis studies the problem of determining wartime military airlift capability and factors within the military airlift system which produce significant changes in system capability as measured in tons of cargo delivered after 30 days of system operation. The airlift mission is set in a scenario which requires the reinforcement of Western Europe against a Warsaw Pack attack. This reinforcement is provided by C-141 and C-5 aircraft. To examine the performance of the airlift system, a simulation model was created using the SLAM simulation language. This model encompasses the four major subsystems within the airlift system; these subsystems are aircrew, maintenance, supply, and aerial port. These subsystems employ resources which are pooled at two locations (one in the United States, and one in Europe). A five-factor, two-level factorial design is employed to reveal those factors that produce significant changes in system capability. A total of 32 simulations were performed and the results were subsequently run through an analysis of variance (ANOVA) algorithm. The five factors investigated are: time to spare parts depletion; resupply time distributions; number of C-141s; number of cargo loading equipment; and the cargo load availability rate.

A Parametric Analysis of Three Models for Direct Delivery by a Naval Supply Center to a Naval Air Rework Facility.
Master's thesis,
Mary Ellen Davidson. Mar 81, 55p

This thesis provides a parametric analysis of three models for direct delivery by a Naval Supply Center (NSC) to a Naval Air Rework Facility (NARF). The models include both scheduled and unscheduled deliveries. Parameters which were studied included the ratio of delay cost to delivery cost and the probability of a repair part being demanded by a component undergoing repair. The decision variables were the time between deliveries for scheduled deliveries and the number of units of an item delivered for unscheduled deliveries. The impact on the decision variables of varying the parameters was the major focus of the analysis. The results of the analysis suggest that scheduled delivery is a good direct delivery strategy for an NSC to use in supporting a NARF. However, the analysis has shown that the expected total cost for all three alternatives is very close. Therefore, the final criterion for which alternative should be chosen is essentially ease of usage and implementation.

Application of Advanced Decision-Analytic Technology to Rapid Deployment Joint Task Force Problems.
Interim technical rept.,
Robert B. Pirie, Jr., Gary A. Frisvold, and Terry A. Bresnick. Jun 81, 71p Rept no. TR-81-7-328.13
Contract MDA903-81-C-0192, DARPA Order-4090

The primary task of this project was to demonstrate the application of advanced decision-analytic technology to the problems of an operational military staff, in this case the Rapid Deployment Joint Task Force (RDJTF) staff. A secondary task was to determine the usefulness of advanced decision-analytic products to the RDJTF staff, and transfer, if possible, a decision-analytic capability for a specific problem to them. As a result of discussions with RDJTF personnel, Decisions and Designs, Inc. (DDI) selected a problem that seemed most promising in terms of applying advanced techniques and of providing the RDJTF with a useful product in the near term. This problem concerned the provision of an adequate support architecture in the Persian Gulf/Indian Ocean area for the deployment of the RDJTF. DDI constructed a hierarchical resource allocation model to demonstrate the feasibility of optimizing the support architecture for deployment forces of different sizes, by making trade-offs within and between base structure, prepositioned materiel, and airlift/sealift assets. To avoid classification problems, hypothetical values were assigned to the parameters of the model. However, the base structure submodel was built in close consultation with members of RDJTF staff, and actual costs and effectiveness estimates were produced. These cost and the effectiveness estimates will greatly facilitate prioritization of support for military construction programs, permit rapid exploration of the usefulness of new proposed base options, and add to understanding whether and how decision-analytic techniques can be transferred to military operational staffs. An Application of Living Systems Theory to Combat Models.
Master's thesis,
Raymond R. Crawford, Jr. Mar 81, 96p

This thesis proposes a framework for icorporating organizational aspects in combat models. It begins by explaining Dr. James G. Miller's Living Systems Theory (LST) as a possible framework. Included in this discussion is a review of the basic nature and potential of LST. A review of the Army's involvement with LST and its present status is discussed. Recommendations are made for supplemental research which may help to develop this framework for the Army. A review explains present combat model limitations for describing organizational phenomena in combat. Finally, a methodology is proposed to integrate the results of LST into combat models of the future. Included as an Appendix, is a discussion of General Systems Theory which will help to explain the basis for LST. (Author)

Guerrilla Warfare: Cause and Conflict (A 21st Century Success Story.),
Walter R. Thomas. 1981, 91p Rept no. NATL SEC ESSAY SER-81-3

Guerrilla force have conducted irregular warfare-with varying degrees of intensity and success-in all ages and all regions of the world, from biblical times to the present. This essay contends that this spectre will haunt the world even more menacingly in the twenty-first century. It states that an overpopulated earth, combined with the failure of governments to meet the social needs of their people, is driving the disillusioned and despairing ever more rapidly toward active participation in, or support of, guerrilla organizations. Although this essay is oriented toward the year 2000 and beyond, the author notes that the emotional forces which ignite conflicts already exist in most of the underdeveloped nations and soon will jolt more advanced societies as well. Actions that national leaders might take to lower the threshold of threat and to deter the growth of guerrilla organizations are suggested, together with the observation that many of the deterrents would be difficult to implement within democratic societies.

A Detailed Review of the TACWAR Model.
Technical memo.,
John C. Ingram. Dec 80, 80p Rept no. HDL-TM-80-15
See also HDL-TR-1918.

A review of the TACWAR theater-level combat simulation model has been completed as an initial prerequisite to the primary objective of augmenting TACWAR to include Command, Control, and Communications Degradation considerations. This review has revealed a number of logic and programming bugs in the model that could also have remained undetected in other versions of the model throughout the TACWAR community of interest. It is the intent of the author to help the community eliminate these potential errors by cataloging them point by point and by recommending corrections. (Author)

Analysis and Modeling of Battlefield Fire Plumes.
Final rept.,
James H. Thompson, and John g. Devore. Feb 81, 110p ERADCOM/ASL-CR-81-0072-2
Contract DAAD07-80-C-0072

This report presents models for the hot turbulent plumes above tactical battlefield fires. Models are developed for the plume radius, temperature, and rise velocity as a function of altitude given the initial fire conditions. The strength of the hot air turbulence is related to the plume parameters for several assumed flow conditions. The turbulent propagation effects are evaluated for optical beams whose paths intersect the plume. Sample results are presented for coherence length, short- and long-term beam spreading, and beam jitter. (Author)

DAIS Models Simulation System (DMSS).
Final rept. 14 Jun 79-14 Nov 80,
Audrey C. Brewer. May 81, 57p AFWAL-TR-81-1053
Contract F33615-79-C-1739

The DMSS software support effort enhanced the capabilities and value of DMSS by accomplishing the following four objectives: (1) Addition of VATS/Pave Tack and Maverick Missile models; (2) Enhancing the existing software; (3) Creating meaningful, up-to-date documentation; and (4) Providing comprehensive training. The new models were developed using top-down structuring techniques and were implemented in RATFOR (a structured FORTRAN preprocessor). The existing models were restructured using top-down structuring techniques, RATFOR, and meaningful comments. The documentation was updated to adhere to MIL-STD-483 and 490. (Author)

Simulation of Underwater Diversity Array.
Quarterly progress rept. no. 33,
Fred Haber, and Paul Yeh. 12 Nov 80, 12p
Contract N00014-77-C-0252

The objective of the system is to approach a condition in which the multiple ray arrivals from a distant source are separately received and coherently combined. Because the analytical forms giving the final output signal-to-noise ratio (SNR) are too involved for direct computation, simulation experiments were carried out. Results of this work are presented for the system described which is based on maximal ratio combining (MRC) of the multiple rays formed. At the same time certain other cases were simulated in order to see what magnitude of improvement is obtained using this method over simpler ones. Given below are results for (1) a three-dimensional array with multiple beams (branches) using only coherent phasing of branches (known as equal gain combining (EGC), (2) a three-dimensional array with multiple beams using selection of the maximum amplitude branch (known as selection combining (SC)), (3) a three-dimensional array with a single fixed focus beam, and (4) two-dimensional array.

Multipath in the Three-Dimensional Underwater Array.
Quarterly progress rept. no. 31,
Fred Haber. Nov 79, 12p
Contract N00014-77-C-0252

A planar array of widely dispersed hydrophones deployed in a horizontal plane several hundred meters below the surface of the sea was analyzed. Because of the dispersive nature of the underwater medium, signal energy approaches the array from a source along a number of refracting paths. This results in multipath interference and a possible consequent loss of output. Ray arrivals from the source typically fall into a range of vertical angles at the receiver which are + or - 10 relative to the horizontal. The vertical beamwidth of a planar antenna is large enough to accept all rays in such a range, hence it is multipath sensitive. A three-dimensional array is capable of a sharper vertical focus and will be less sensitive to the kind of multipath typical in this application. In fact, by suitably processing the array output there is the possibility that the multipath arrivals can be separately received and then combined in phase to achieve an 'angle of arrival diversity' system. Such systems have been proposed for tropospheric scatter receivers.

Tracking Near Surface Drogues Using and Acoustic Travel Time Technique in Shallow, Highly Stratified Water- Problems and Observations.
Technical rept.,
James H. Churchill. May 81, 49p WHOI-81-37
Contract DE-ACO2-79EV10005, Grant 03-5-022-26

During July and August of 1980 near surface water velocities of Lake Huron were measured by tracking drogues, equipped with sonobuoys, using an acoustic travel time technique. Prior to these experiments difficulties associated with acoustic ray bending in the shallow, highly stratified environment were anticipated. Simple models were developed to predict the errors in drogue position and velocity determination resulting from ray bending. During the experiments round trip travel times of acoustic pulses transmitted between three bottom transponders and a transducer (lowered from a ship) were recorded. Evidence also indicated that increased thermocline depth resulted in decreased tracking range.

Models of Conflict, with Explicit Representation of Command and Control Capabilities and Vulnerabilities.
Technical rept.,
Donald P. Gaver. Feb 81, 50p Rept no. NPS55-81-008

This report describes dynamic combat models that reflect the effect of information flows together with attrition capability upon combat progress and outcome. Command and Control assets for each participant are modeled as endowed with the capacity to guide combat; C2 is also vulnerable in that it may be deliberately targetted and reduced in effectiveness. Physical attrition is modeled first by a deterministic rate process (Lanchesterian in nature), secondly by a stochastic process related to the first by ideas related to those of stochastic difference and differential equations. The models are best exercised and explored on an interactive computer display. A FORTRAN program exists for this purpose, with displays of hypothetical historical combat outcomes new appearing in tabular form. Graphical displays will be provided in future work. It seems likely that this model simulation can be developed into a gaming tool, very conveniently playable by two persons who can elect various strategies for force allocation, play the game, and learn from the results. An elaboration of the model may serve as a means for assessing the importance of increased effectiveness of equipment, either with respect to firing rate and accuracy or time for information flow. Noise Suppression Methods for Robust Speech Processing.
Final technical rept. 1 Oct 78-31 Mar 81,
Steven F. Boll, James Kajiya, James Youngberg, Tracy Lind Petersen, and H. Ravindra. Apr 81, 53p Rept no. UTEC-CSC-81-020
Contract N00173-79-C-0045, ARPA Order-3301

Robust speech processing in practical operating environments requires effective environmental and processor noise suppression. This report describes the technical findings and accomplishments during the reporting period for the research program funded to develop real-time, compressed speech analysis-synthesis algorithms whose performance is invariant under signal contamination. Fulfillment of this requirement is necessary to insure reliable secure compressed speech transmission within realistic military command and control environments. Overall contributions resulting from this research program include the understanding of how environmental noise degrades narrow band, coded speech, development of appropriate real-time noise suppression algorithms, and development of speech parameter identification methods that consider signal contamination as a fundmental element in the estimation process. This report describes the research and results in the areas of noise suppression using the dual input adaptive noise cancellation articulation rate change techniques, spectral subtraction and a description of an experiment which demonstrated that the spectral substraction noise suppression algorithm can improve the intelligibility of 2400 bps, LPC-10 coded, helicopter speech by 10.6 points. In addition summaries are included of prior studies in Constant-Q signal analysis and synthesis, perceptual modelling, speech activity detection, and pole-zero modelling of noisy signals. Three recent studies in speech modelling using the critical band analysis-synthesis transform and using splines are then presented. Finally a list a major publications generated under this contract is given. (Author)

Investigation of Continuously Variable Slope Delta Modulator/Demodulator Compatability.
Master's thesis,
Jeffrey Allan Lersch. Dec 80, 168p Rept no. AFIT/GE/EE/80D-28
Availability: Microfiche copies only.

A computer model of the continuously variable slope delta voice encoding system specified in the draft STANAG on 'Analogue/Digital Conversion of Speech Signals for Tactical, Digital Area Communication Systems', dated June 1978, is developed and implemented in FORTRAN IV. The model's performance is then characterized in terms of idle channel noise, total harmonic distortion, intermodulation distortion, signal-to-noise ratio, and frequency response. For each of these attributes, the system's performance is presented graphically and compared to the criteria established in the draft standard. The model is then exercised by varying the system parameters to the limits imposed by the standard and the resulting performance compared to the previously determined ideal system performance. The results show that the performance characteristics measured are most sensitive to the primary integrator response and output filter response when the system parameters are restricted to the range allowed by the draft NATO standard. Prototype and Software Development for Universal Network Interface Device.
Master's thesis,
Lee R. Baker. Dec 80, 81p Rept no. AFIT/GCS/EE/80D-4

This thesis describes the third phase of the development and testing for a flexible message processor designed for computer communications network applications. This message processor is microcomputer based and is called a Universal Network Interface Device (UNID). The thesis describes the upgrading of the two system monitors, the design of two memory boards, the development of a test plan for testing the device, and the results of the testing that was performed. The device employs two microcomputer boards, a local card, a network card and two memory boards to provide the capability to interface local users to a computer communications network. The device also provides the capability to act as the node connecting two networks operating under dissimilar protocols. The purpose of this investigation was to have an operational UNID. This investigation was limited to the development and testing of the prototype UNID and the software to support it. No attempt was made to integrate the prototype into an actual computer communications network.

Simulation and Analysis of AUTODIN II Network Design.
Master's thesis,
James W. Healy, and Denzel H. Henderson. Dec 80, 274p Rept no. AFIT/GCS/EE/80D-9

The AUTODIN II computer communications network is expected to provide for present and future Department of Defense communications requirements. The proposed AUTODIN II network configuration is designed to provide reliable communications and minimal time delay for both interactive and timesharing and transaction-oriented systems. As development towards an operational network proceeds, questions concerning efficiency and optimality of the network are asked by both the design managers and future AUTODIN II users. To answer these questions, a simulation program at the switch control module (SCM) hierarchal level was developed. It allows the user to: (1) Change the configuration network connectivity and add or delete nodes, SCMs, links and lines; (2) Generate various communication traffic levels from any source location and to any destination location; (3) Define network parameters, such as priorities, percentages of packet sizes, transmission times and special workload identification; and (4) Perform any of the previous options dynamically to analyze the effects of network configuration failures or catastrophic events. A user's manual is provided.

Design of a Resource-Sharing Network Link.
Master's thesis,
Thomas M. McLeod. Dec 80, 131p Rept no. AFIT/GE/EE/80D-30

A resource-sharing (R-S) computer network link design is presented. The design complies with requirements for the Automated Management System (AMS) being developed by the Air Force's Aeronautical Systems Division (ASD). The design includes Texas Instruments Model 990 computers that currently exist in the AMS Network. R-S software was designed that binds existing modules into, effectively, one R-S process at each end of the link. The two R-S processes cooperate in accordance with R-S protocols to accomplish the specified R-S functions. Existing capabilities of the DX-10 operating system were used extensively. The processes communicate via telephone circuits using TI 3780 Emulator software and standard data communications hardware. The R-S functions implemented include file transfer, program file transfer, and remote program execution, as well as others. A unique interface to the DX-10 operating system was designed to allow the R-S software to have adequate access to the operating system. The operating system batch command was emulated, allowing the R-S program to construct a batch file containing any operating system commands that would normally be entered from a interactive terminal. Transmission Loss Prediction for the AN/TRC-97A Over a Tropospheric Scatter Path.
Master's thesis,
H. Stephen Story. 12 Dec 80, 123p Rept no. AFIT/GE/EE/80D-40

This research investigates transmission loss predictions for a short range tactical troposcatter radio system. The analysis is based on the AN/TRC-97A radio set, but the conclusions reached should apply to similar troposcatter systems operating at frequencies from 4.4 to 5.0 GHz and over distances of 160 km or less. A general analysis of the troposcatter path is performed to determine the sensitivity of the transmission loss of the various phenomena which contribute to the loss. That component of the loss which is unique to the scattering process is studied in further detail and a modified scattering loss model is developed. A procedure for determining the coefficients of the scattering loss model based on observed transmission loss is described. A preliminary analysis of the path data available for this research is performed. It is found that the received power probability distribution for the observed paths does not agree with the theoretical distribution in all cases. Further, the available path data is seen to lack sufficiently detailed path geometry information to complete the analysis of the scattering loss model. Recommendations concerning data requirements and continued research are offered. (Author)

Availability: Microfiche copies only.

This report discusses four topics: (1) Operation of a frequency acquisition aid to acquire a direct sequence or frequency hopped signal. The acquisition aid employed is a FFT, and repeated measurements are employed to reduce the probability of error; (2) Multiple access using dynamic reservations. Here a new multiple access technique is described in which reservations are made which indicate whether the number of packets to be transmitted is to be increased or decreased. This technique is compared to the generally used procedure of indicating in the reservation the exact number of packets to be sent, a technique which requires significantly more bandwidth. (Author)

Automatic Assessment of the Quality of Group 3 Facsimile Transmission.
Final rept.,
Richard A. Schaphorst. May 81, 28p NCS-TIB-81-5
Contract DCA100-80-C-0042

Group 3 facsimile equipment transmits an end of line code (EOL)which uniquely defines the end of one scan line and the beginning of the next. In a sense this code is redundant information and therefore can be used to detect the occurrence of a transmission error in the scan line immediately preceding the EOL code. Stated another way, if the EOL code does not occur at the anticipated location in the data stream, it is assumed that a transmission error has occurred in the preceding scan line. If one isolated scan line is in error, the subjective effect is usually minimal and the information content is maintained. If however, many scan lines in a row are perturbed the image could be seriously distorted with the attendant user dissatisfaction. It is possible for the receiver to detect the occurrence of a scan line error, accumulate this information for many lines, and terminate transmission if too many scan lines are in error. The purpose of this study is to develop test data to determine the algorithms for accepting or rejecting an image transmission using scan line error data.

C3 Modified TACWAR Model.
Technical rept.,
John C. Ingram. May 81, 76p Rept no. HDL-TR-1918

The TACWAR theater-level combat simulation model has been modified to include command, control, and communications degradation (C3/D). Specific areas where C3/D has been incorporated include combat division assets, corps-sector assets, and theater (COMMZ) assets. The results of C3/D impact division combat effectiveness, nuclear and chemical authorization and release processing delays, target acquisition delays, and nuclear and chemical delivery system and warhead inventory effectiveness. The C3/D modified TACWAR model has been run using an unclassified 'benchmark' data base. Communications degradation and message processing delay data are provided by the TACNET theater-level C3 model. Parametric studies reveal the effect of C3/D on the results of theater-level engagements. (Author)

Error Probability Characteristics for Multiple Alternative Communication with Diversity, but without Fading.
Technical rept.,
Albert H. Nuttall. 4 May 81, 40p Rept no. NUSC-TR-6473

The M-ary character error probability, Pe, for a communications system employing D-fold diversity combination is derived and evaluated for the case of no fading, over the range of parameters M = 2, 3, 4, 8, 16, 32, 64, 128, 256, 512, 1024 and D = 1, 2, 3, 4, 6, 8, 12, 16, 24, 32, 48, 64 for Pe in the range .1 to .00001. The curves presented allow for ready determination of the additional signal-to-noise ratio required for employing diversity when it is not necessary, or when uncertainty forces it upon the receiver processing. Extensions to a thresholding receiver and to a very general class of signal fading are also made, but no numerical results are given for these latter cases. (Author)

Soviet Command and Control in an Historical Context.
Master's thesis,
Jeffrey Arthur Kern. Mar 81, 202p

An examination is made of the historical antecedents of present day command and control doctrine in the Soviet Union. The continuity of principal characteristics is demonstrated. The ideological determinants shaping the command and control system are first developed. These include centralism, collective decision-making, unity of command, and redundancy. Practical consequences of these are explored. The functioning of Soviet command and control during World War II is addressed in detail, with emphasis on the uniquely Soviet aspects. Current Soviet command and control concepts are addressed in a general way and linked to historical precedents and ideological precepts. Primary source materials are open Soviet doctrinal and historical publications, in translation. (Author)

A Graphic Tutorial and Decoding Program for Navy Signal Flags and Pennants.
Master's thesis,
Jay Kent Bien. Mar 81, 50p

This is a highly graphic user-oriented interactive software product which will assist the user to become more proficient at recognizing and employing Navy signal flags, and pennants which are used for visual communications between naval vessels of all types. A tutorial portion of the program has been designed with a number of options, thereby allowing a user to tailor a recognition program to satisfy specific learning requirements. The program is also capable of graphically disolaying any grouping of flags and pennants chosen by the user in flaghoist order. When the flags and pennants are arranged in accordance with the procedural doctrine set forth in the ALLIED MARITIME TACTICAL SIGNAL BOOK, ATP 1(B), Volume II, the program demonstrates the capability of decoding the displayed signal into its predetermined meaning. The current program is resident in the Secure Command, Control and Communications Exercise Laboratory (C3 Lab) at the Navy Postgraduate School. (Author)

Command Center Network: Scope and Applications.
Master's thesis,
George Kendall Hamilton, Jr. Mar 81, 82p

The Command Center Network (CCN) is a computer network designed to interconnect a diverse group of heterogeneous shipboard information and Command and Control (C2) subsystems. This local network will utilize a single, high-speed data bus installed on the individual platform. As this network is envisioned, such subsystems as NTDS, NAVMACS, CCIS, SSES, TSA, CV-TSC, and CV-IC will be interconnected in order to correlate infor-

mation to provide the best possible decision base for the commander. The Tactical Flag Command Center (TFCC) concept, which the CCN is essentially designed to support, is considered by the navy as the nerve center of future Command and Control. The CCN is envisioned to be the backbone of the TFCC. This thesis examines the system development of the CCN. (Author)

This report documents the results of the concept definition phase for a high capacity wideband general purpose data/communications bussing system. A 'Flexible Intraconnect' bus concept is described in terms of its use to achieve physical and functional modularity in the design, implementation and operational deployment of command and control (C2) centers of the Tactical Air Force (TAF). Flexible Intraconnect (FI) design parameters are established in terms of traffic loading estimates and requirements of evolving configurations of C2 centers of the TAF. Surveys of data distribution system architectures, current and developing technologies and C2 device interfaces are provided. A design of a Flexible Intraconnect having high data rate and capacity, positive flow control and configuration flexibility is documented. A standardized interface for physical and functional device to bus access is described. Descriptions of the major functional elements of the FI are provided along with top level block diagrams. The design was analyzed and preliminary estimates of error performance, reliability, capacity and response times were derived. Results obtained from this phase will be used in specifications for the subsequent development phase of the FI program. (Author)

A practical FI design concept which meets Tactical Air Force Modular C3 goals has been developed. It is recommended that the preliminary FI design be demonstrated and evaluated in a development program which connects typical C3 devices into an operational configuration. Conclusions: The developed FI concept meets TAF MOD C3 goals, A MOD C3 Standard Interface is defined which promotes C3 interoperability; and The preliminary design exploits advanced technology and is ready to be implemented. Recommendation: Develop the Flexible Intraconnect hardware and software to provide a vehicle for demonstrating and evaluating the concept in a realistic TAF C3 environment.

This report documents the preliminary design for a high capacity wide-band general purpose data/communications busing system. The bus, called a 'Flexible Intraconnect,' (FI) will be used to achieve modularity in the design, implementation and deployment of command, control and communications (C3) centers of the Tactical Air Force (TAF). FI design requirements were established by estimates of traffic loads for current and future (through 1980) configurations of Tactical Air Control System (TACS) C3 centers of the TAF. Surveys of data distribution system architectures, current and developing technologies, and device interfaces are provided. A design of a Flexible Intraconnect having high transmission rate and capacity, positive flow control and configuration flexibility is described. A standardized interface for physical and functional device to bus access is described. Description of the major functional elements of the FI are provided along with top level block diagnosis. The design was analyzed and preliminary estimates of error performance, reliability, capacity and response times were developed.

The 30/20 Gigahertz Transponder Study.
Final Report.
Dec 80, 114p NASA-CR-165295
Contract NAS3-21508

Design features and performance parameters are described for three types of wideband multiple channel satellite transponders for use in a 30/20 GHz communications satellite, which provides high data rate trunking service to ten ground station terminals. The three types of transponder are frequency division multiplex (FDM), time division multiplex (TDM), and a hybrid transponder using a combination of FDM and TDM techniques. The wideband multiple beam trunking concept, the traffic distribution between the trunking terminals, and system design constraints are discussed. The receiver front end design, the frequency conversion scheme, and the local oscillator design are described including the thermal interface between the transponders and the satellite. The three designs are compared with regard to performance, weight, power, cost and initial technology. Simplified block diagrams of the baseline transponder designs are included.

Contract NAS5-24421

A 12-channel synchronous phase lock video receiver consisting of an outdoor downconverter unit and an indoor demodulator unit was developed to provide both low noise performance and low cost in production quantities of 1000 units. The prototype receiver can be mass produced at a cost under $1540 without sacrificing system performance. The receiver also has the capability of selecting any of the twelve assigned satellite broadcast channels in the frequency range 11.7 to 12.2 GHz.

Frequency Domain Measurements of Microwave Absorber Design Materials.
Master's thesis,
Donald G. Aguirre. Dec 80, 165p Rept no. AFIT/GE/EE/80D-8

Using frequency domain techniques, a system was developed to measure the complex permittivity and permeability of different materials in the Ku band (12.4 to 18 GHz). A sample of fiberglass, teflon, FGM-40, and two different plexiglas configurations were chosen for this experiment. The newly developed measuring system consisted of a two horizontal-plane sectoral horn and a sample holder assembly. A 9.5 x 0.8 cm piece of the sample material was cut and fitted into the sample holder assembly. The reflection and transmission coefficients for the sample were measured, using a network analyzer and frequency synthesizer as the swept frequency signal source. A dedicated computer calculated the complex permittivity and permeability and plotted the output data. The two configurations of plexiglas and the fiberglass sample were tested ten times to obtain a statistical representation of the results. The permittivity and permeability obtained for the selected samples using the frequency domain measurement technique were compared with the results obtained in a previously developed system which used time domain techniques. The data comparison between the two systems was good for teflon, plexiglas, and fiberglass in the frequency range from 12.4 to 16 GHz. Some variations were noted for the FGM-40. Since the results obtained were generally consistent between both techniques, it is claimed that the newly implemented frequency domain system is a viable alternative for the rapid measurement of intrinsic properties in the Ku band.

Error-correcting Code Performance in a Modeled ECM Environment.
Master's thesis,
Dennis James Rensel. Dec 80, 145p Rept no. AFIT/GE/EE/80D-37

Electronic countermeasures (ECM), such as broadband, switched broadband, continuous wave and multitone jamming, are designed to disrupt communication systems. The subject of this thesis is the effect of these ECM on the performance of error correcting codes in an additive Gaussian noise channel. The channel is modeled with two convolutional coders having a rate of 1/2 and constraint lengths of 2 and 6, an 8-ary FSK modulator and demodulator, and a decoder based upon the Viterbi algorithm. Two measures of effectiveness are the probability of bit errors P(b)(e) for the waveform channel and the bit error rate (BER) for the overall channel performance. It is shown that both P(b)(e) and BER are increased by the previously mentioned ECM. To aid in evaluating the performance of these coders, a simulation program was written. In the program, the transmission signal, the channel noise, and the jamming signal are independent of each other. the basic conclusions for these two convolutional codes are that the dual-three encoder with the longer codeword performs better in the no jamming or in a Gaussian jamming environment, while the CC1 encoder with the shorter codeword performs better in a CW jamming environment. (Author)

Characterization of Aerosol Nonlinear Effects on a High Power CO2 Laser Beam.
Final rept.,
C. W. Bruce, Y. P. Yee, and S. J. Duran. Feb 81, 73p Rept no. ERADCOM/ASL-TR-0074

This report describes a set of aerosol measurements to determine the effect of a countermeasure smoke, white phosphorus (WP), on a pulsed high-energy laser (HEL) beam. An analysis of the aerosol (gaseous and particulate airborne material) was used as the basis for calculations of evaporative clearing, and application was made to a given specific test situation. Linear propagation properties forming the basis for the 10.6 micrometers pulsed laser nonlinear effects are obtained relatively directly by using spectrophone absorption and extinction, a light scattering particle spectrometer and nephelometers (particle density as a function of radius and mass loading), and dew-point hygrometer (partial pressure of water vapor). General conclusions are that, for the smoke produced by burning WP, a CO2 pulsed HEL beam clears the optical path quite rapidly and efficiently. The absorption after clearing is caused by the residual vapors and is much lower. (Author)

Helium Purge Flow Prevention of Atmospheric Contamination of the Cryogenically Cooled Optics of Orbiting Infrared Telescopes: Calculation of He-O Differential Cross Section,
Nancy m. Harvey, and Ronald R. Herm. 5 Jun 81, 86p TR-0081(6432-03)-1, SD-TR-81-53
Contract F04701-80-C-0081

The ability of an He purge gas to protect the cryogenically cooled optics of orbiting infrared telescopes from the primary atmospheric contaminant, atomic oxygen, can be estimated by Monte Carlo calculations simulating the He-O scattering events that would occur in the operating telescope. We report the results of accurate quantum mechanical calculations of the He-O differential cross sections sigma(theta, E) needed in such Monte Carlo calculations. To facilitate the use of these cross sections in Monte Carlo calculations, we have constructed a simple separable function of E and theta which provides an adequate representation of sigma(theta, E) for the entire range of relative collision energies studied, E = 0.02 to 1.66 eV. For high relative collision energies, we have also tested the accuracy of the computationally simpler WKB approximation. (Author)

Magnetostrictive Optical Fiber Cable and Magnetic Field Detector, and Method thereof.
Patent Application,
Ammon Nariv, and Harry V. Winsor. Filed 12 Jan 81, 17p AD-D008 542/3
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

An optical fiber cable and magnetic field detector magnetostrictively reactive to the presence of an external magnetic field is presented. The optical fiber cable comprises a elongated optically transparent core sheathed by a magnetostrictively responsive jacket disposed about the periphery of the core. The jacket responds to magnetic fields present and strains the core effecting the light transmission of the core. The effect upon the light transmission by the jacket is detected by interferometry for determining the presence of the magnetic field. (Author)

RF Command and Ranging System for Balloon Flight Applications.
Final rept. 1 Jun 77-31 Oct 80,
T. J. Rosenberg, and F. J. Lebert. 1 May 81, 23p Rept no. BN-967
Contract N00014-77-C-0423
Prepared in cooperation with DACOM Corp., Arnold, MD.

This paper describes a radio frequency (RF) command and ranging system developed to provide the scientific balloon community and other users with a versatile, self-contained system for remote control applications. Emphasis has been placed on limiting the weight, size, and cost of the remote unit in order to make the system economical in applications where recovery is not practical. The design incorporates several unique features which allow for expanding the degree of sophistication obtainable in balloon command and control. Upon command, the base station transmits a self-clocking, pulse code modulated signal and receives a status signal reply from the remote unit. The base station and remote unit operate in simplex mode utilizing the same carrier frequency for both transmission and reception. The system provides slant range accurate of + or - 3 nautical miles, command and status of 15 independent channels, and flight termination control. Successful flight tests have been performed in New Mexico and Antarctica. (Author)

Sensitivity Study of Strapdown Inertial Sensors in High Performance Applications.
Master's thesis,
John E. Ryan. Dec 80, 225p Rept no. AFIT/GE/EE/80D-38

This study uses a computer simulation of a strapdown laser gyro inertial reference system to analyze the errors generated as a result of highly dynamic flight profiles. A stochastic error model using state-of-the-art inertial sensors is developed in detail and implemented in software. SOFE, a generalized simulation program, was used to implement both a Monte Carlo simulation and a covariance analysis. The Monte Carlo method was selected to perform the error analysis. Two highly dynamic flight trajectories were developed using the flight profile generator, PROFGEN. The PROFGEN program itself was modified to include an aircraft roll time constant and a roll-only maneuver. The errors generated in the inertial reference system as a result of these flight trajectories were investigated. Both an error budget and an analysis of the maneuvers inducing these errors were accomplished. Gyro error sources induced the most system error and coupled the dynamics of the flight trajectory into the variations of the error. Misalignment was found to be the major cause of both the accelerometer and gyro induced error. Successive maneuvers were found that reinforced system errors and other maneuvers were found that cancelled these errors. Also, some cases were found where the amount of system error varied with a change in heading. (Author)

Worldwide OMEGA and Very Low Frequency (VLF) Transmitter Outages, January to December 1980.
Data rept. Jan-Dec 80,
Lorraine Rzonca. May 81, 24p FAA-CT-81-26, FAA-RD-81-29

An investigation of worldwide OMEGA and very low frequency (VLF) transmitter outages during 1980 was conducted with emphasis on simultaneous outages. Data includes frequency and duration of simultaneous outages and total yearly percentage shutdown for each transmitter. Scheduled outages are specifically noted. The most significant dual OMEGA outage lasted 4.9 hours when the Argentina transmitter was shutdown to correct tower structural problems while La Reunion was down for annual maintenance. (Author)

A Kalman Filter Approach to Navigation on the NAE Convair 580 Aeromagnetics Research Aircraft (L'Apport du Filtre Kalman Dans le Systeme de Navigation de L'Aeronef de Recherche Aeromagnetique nae Convair 580),
B. W. Leach. Feb 81, 111p NAE-LR-604, NRC-19271
Abstract in French.

Doppler radar, compass heading, and VLF communications station phase difference information are combined in an optimal fashion to form an ten-state Doppler/VLF Kalman filter navigation algorithm is designed for use onboard the NAE Convair 580 aeromagnetics research aircraft, with simulation studies conducted using computer programs written in FORTRAN for the IBM 3032 TSS operating environment. Results from the studies show the unique features of a Kalman filtering approach to the navigation task. Various contingencies, or anomalous situations, that can arise when handling the VLF data are considered, and solutions are offered in the context of the Kalman filter approach being used. A comparison study involving simulated navigation data demonstrates the superiority of the Kalman filter navigator compared to simpler navigation algorithms, especially when significant bias errors occur in the basic quantities being measured. A further comparison study based on navigation data collected onboard the Convair verifies that the proposed Kalman filter navigation algorithm operates properly when using typical 'real world' data. Modeling a Cryogenic HE3 Nuclear Gyro.
Interim rept.,
Gerald L. Shaw. Dec 80, 90p SUDAAR-525, AFOSR-TR-81-0523
Contract F49620-78-C-0088

Over the last two decades, several nonconventional gyro schemes have been proposed. Directed primarily at eliminating the bearing problems in conventional mechanical gyros, it was anticipated that either better performance could be achieved or performance comparable to conventional gyros could be achieved at a lower cost. No attempt is made here to compare or contrast all of these various schemes, but rather to look at certain aspects of a particular device, a cryogenic He3 nuclear gyro, and to provide models for estimating its performance. The nuclear gyro is highly dependent upon the stability and homogeneity of the magnetic field environment. A combination of low temperature physics technologies makes such a device practical. By generating the applied field with superconducting coils the stability of the field is guaranteed by the inherent stability of the persistent super-currents in these coils. Then protection from a changing external environment is provided by enclosing the device within a superconducting shield. Nevertheless, even in an ideal magnetic field environment, the nuclear gyro is subject to various rectification mechanisms. Of particular interest is the role kinematic rectification plays in this device. Rectification mechanisms are discussed, and mathematical models derived for calculating the methods of kinematic rectification drift. An experiment designed to measure and distinguish the kinematic rectification effects are discussed. The effects of thermal gradients and accelerations in the presence of an inhomogeneous magnetic field are also discussed, and models derived from which their magnitudes are calculated. (Author)

Development and Evaluation of a Prototype In-Flight Instrument Flight Rules (IFR) Procedures Trainer.
Final Report.
J. B. Aaron, Jr., and G. G. Morris. Jun 81, 34p NASA-TM-73292

An in-flight instrument flight rules (IFR) procedures trainer capable of providing simulated indications of instrument flight in a typical general aviation aircraft independent of ground based navigation aids

was developed. The IFR navaid related instruments and circuits from an ATC 610J table top simulator were installed in a Cessna 172 aircraft and connected to its electrical power and pitot static systems. The benefits expected from this hybridization concept include increased safety by reducing the number of general aviation aircraft conducting IFR training flights in congested terminal areas, and reduced fuel use and instruction costs by lessening the need to fly to and from navaid equipped airports and by increased efficiency of the required in-flight training. Technical feasibility was demonstrated and the operational feasibility of the concept was evaluated. Results indicated that the in-flight simulator is an effective training device for teaching IFR procedural skills.

GPS/Doppler Sensor Velocity Derived Attitude Reference System.
Patent Application,
Jack Gray. Filed 17 Apr 81, 16p AD-D008 536/5
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

An accurate and constantly updated attitude instrument is provided for aircraft. The pitch and roll angles are calculated from two sets of velocity measurements, one set being derived from signals received from orbiting navigational satellites and the other set from on-board equipment which determines the aircraft's axial velocities. The on-board equipment may be a Doppler groundspeed sensor or an inertial system using accelerometers, the outputs of which are integrated to derive the axial velocities. (Author)

Optical Phase Estimation from Integrated Samples of the Heterodyned Wavefront.
Master's thesis,
Martin B. Mark. Dec 80, 87p Rept no. AFIT/GEO/EE/80D-3

A method for using integrating detectors to estimate the phase of an optical wavefront is investigated. The phase and amplitude are assumed to vary slowly compared to the integration time and the integrated samples are shown to be corrupted by white gaussian noise. A maximum a-posteriori nonlinear Kalman filter is derived and simulated for both constant and random walk phase processes. The performance of the filter is compared to its Cramer-Rao lower bound and a first order linearized phase-locked loop (PLL). The filter never performs a great deal better than the PLL, but it can be implemented in a low bandwidth system whereas the PLL assumes a wideband system. The local oscillator is initially assumed to be stabilized in frequency and amplitude, and later a frequency shift is introduced. The filter manages to acquire and track the phase in a high carrier-to-noise ratio (CNR) environment although it does not estimate the frequency shift well. At 30 db CNR, the phase is estimated within about 0.02 radians, whereas the frequency shift estimation error is on the order of 500 kHz for frequecy shift of 2MHz. (Author)

Adaptive Laser Pointing and Tracking Problem.
Master's thesis,
James Singletery, Jr. Dec 80, 112p Rept no. AFIT/GEO/EE/80D-12
Availability: Microfiche copies only.

The digital implementation of a negating phase shift that operates perfectly under ideal conditions was a major accomplishment. The establishment of a zero level of 10 to the -8th power was also significant. The incorporation of the exponential smoothing technique to minimize the effect of measurement noise was important since it uncovered a possible connection between the size of the target image and its performance throughout the pattern recognition process. However, the major obstacle that surface during the execution of this project was a filter divergence problem. It has been proposed that this problem can be solved by implementing the Fourier transform derivative property instead of the forward-backward difference method to compute the spatial derivative of the non-linear h function.

Radar Beacon Transponder (RBX) Functional Description.
Project rept.,
Ronald G. Sandholm. 18 Feb 81, 31p ATC-104, FAA-RD-80-135
Contracts F19628-80-C-0002, DOT-FA77WAI-817

The Radar Beacon Transponder (RBX) is a ground-based transponder used to control the threat detection sensitivity level of BCAS aircraft operating in high density terminal airspace. The RBX is also used to deliver displayed resolution advisories from BCAS to the ATC facility. The normal DABS interrogation waveforms and message formats are used for communication between the RBX and BCAS aircraft. The appropriate BCAS sensitivity level is selected by comparing the BCAS aircraft position with an internally stored sensitivity level map of the surrounding airspace volume. This document provides a functional description of the RBX and shows that reliable performance is achievable in the presence ofinterference from ATCRBS and BCAS air-to-air interrogations. (Author)

Multiple Arrested Synthetic Aperture Radar.
Doctoral thesis,
Jerrold s. Shuster. May 81, 298p Rept no. AFIT/DS/EE/81-1

This report contains the formulation and analysis of an airborne synthetic aperture rate scheme which employs a multiplicity of antennas with the displaced phase center antenna technique to detect slowly moving targets embedded in a severe clutter environment. The radar is evaluated using the target to clutter power ratio as the measure of performance. Noise is ignored in the analysis. An optimization scheme which maximizes this ratio is employed to obtain the optimum processor weighting. The performance of the MASAR processor with optimum weights is compared against that using target weights (composed of the target signal) and that using binomial weights (which, effectively, form an n-pulse canceller). Both the target and the clutter are modeled with the electric field backscattering coefficient. The target is modeled simply as a deterministically moving point scatterer with the same albedo as a point of clutter. The clutter is modeled as a homogeneous, isotropic, two-dimensional, spatiotemporal random field for which only the correlation properties are required. The analysis shows that this radar, with its optimum weighting scheme, is a promising synthetic aperture concept for the detection of slowly moving targets immersed in strong clutter environments. ASDE-3 Antenna Development and Test.
Final rept. Jan 80-Apr 81,
Apr 81, 72p TSC-FAA-81-10, FAA-RD-81-43

The ASDE-3 radar antenna was developed so that closely spaced targets on an airport surface could be resolved. The requirement of accurately detecting targets as close as 500 feet from the antenna necessitated some type of near field focussing. A variable focus, shaped beam, doubly curved reflector was designed and successfully tested for

this application. Additional features included an integrated rotating radome and circular polarization. Representative azimuth and elevation patterns are presented. During the development, a method for taking and plotting radiation patterns of the antenna scanning at its operational rotation rate was devised and is described. (Author)

PAT-APPL-6-258 346 PC **A02**/MF **A01**
Department of the Navy, Washington, DC.
Radar Clutter Reduction by Use of Frequency-Diverse, Wideband Pulse-Compression Waveforms.
Patent Application,
Samuel J. Caprio. Filed 24 Apr 81, 19p AD-D008 548/0
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A method is given for generating and transmitting wideband, expanded radar pulses which spatially decorrelate clutter and are frequency-hopped from pulse to pulse by the proper frequency difference for clutter decorrelation by frequency-diversity. The returned signals are compressed, delayed by one pulse interval, and correlated, each with its succeeding echo pulse, to decorrelate the clutter returns but not the target echoes. The frequencies of the transmitted pulses are locked to the local oscillator frequency, which is very stable. A double-sideband technique is used to generate the different pulse frequencies. The Cs exp + pulsed drift tube injector has continued to operate satisfactorily in a program of studying the characteristics of the beam and of developing diagnostic tools. A single beam transport experiment has been designed and fabriction of the components has begun. The purpose of the experiment is the study of transverse beam dynamics and the stability of a space-charge dominated beam traveling through a periodic strong-focussing channel. Increasing attention has been given to multiple-beam heavy ion induction linacs and it appears that there will be significant technical and cost advantages in such a system. Theoretical studies of the longitudinal stability of beams and of longitudinal-transverse coupling have continued. Electrostatic quadrupole beam transport systems have also been an object of study. Engineering development of module components has included experiments with novel ignitrons as well as evaluations of standard ones. Evaluation of magnetic core material also continues. Toroidal Plasma Rotation in the PLT Tokamak with Neutral-Beam Injection.
S. Suckewer, H. P. Eubank, R. J. Goldston, J. McEnerney, and N. R. Sauthoff. Apr 81, 34p
Contract AM02-76CH03073

Toroidal plasma rotation in the Princeton Large Torus, PLT, has been measured for various plasma and neutral beam injection conditions. Measurements of the plasma rotational velocities were made from Doppler shifts of appropriate spectral lines and include data from both hydrogen and deuterium beams and co- and counter-injection at several electron densities. Without injection, a small but consistent toroidal rotation exists in a direction opposite to the plasma current (counter-direction) in the plasma center but parallel to the current (co-direction) in the plasma periphery. Using these measured velocities and the plasma density and temperature gradients, radial electron fields can be determined from theory, giving E/sub r / approx. = 40 V/cm near the plasma center and E/sub r/ approx. = 10 V/cm near the plasma edge. Insertion of a local, 2.5 percent magnetic well produced no observable effect on the beam driven rotation. Modeling of the time evolution and radial distribution of the rotation allows one to deduce an effective viscosity of the order of (1 to 5) x 10 exp 4 cm exp 2 /sec. (ERA citation 06:022886)

Contract AM02-76CH03073

The concept of modular coils originated from a need to find reactor-relevant stellarator windings, but its usefulness can be extended to provide an externally applied, additional rotational transform in tokamaks. Considerations of (1) basic principles of modular coils, (2) types of coils, (3) types of configurations (general, helically symmetric, helically asymmetric, with magnetic well, with magnetic hill), (4) types of rotational transform profile, and (5) structure and origin of ripples are given. These results show that modular coils can offer a wide range of vacuum magnetic field configurations, some of which cannot be obtained with the classical stellarator or torsatron coil configuration. Contract W-7405-ENG-48
Includes 4 sheets of 48x reduction microfiche.

Several applications of plasma equilibrium models require a suitable continuous representation for the magnetic field. For example, numerical generation of single particle orbits in these fields requires that the continuum representation maintain del B = 0 or at least keep it very small. Performing the interpolation analysis in terms of the vector potential, A, guarantees del B = 0 whereas using the magnetic induction, B, does not. The code presented here uses A as the primary dependent variable. A finite element representation employing tricubic splines significantly reduces spatial truncation errors compared to conventional finite difference methods. Some results pertinent to the MFTF-B experiment are presented. Many details about the code are presented on fiche as described in the appendices. (ERA citation 06:022888)

RADHOT: A Radiation Hydrodynamics Code for Weapon Effects Calculation.
Master's thesis,
Douglas P. Wade. Mar 81, 105p Rept no. AFIT/GNE/PH/81-10

RADHOT is a one - dimensional Lagrangian radiation-hydrodynamics computer code developed from a scheme described by John Zinn of LASL. The transport scheme described by John Zinn and Incorporated into RADHOT requires just two passes thru the mesh to determine fluxes and energy deposition rates. The scheme assumes local thermodynamic equilibrium for each cell, and also assumes that the thermal radiation flux contribution in a given direction at any point has one of two values depending upon whether a ray in that direction intersects the source region. The RADHOT code currently suffers from a lack of valid opacity data. The code as currently written is extremely slow and expensive to run. A user's guide and a listing the code are provided as a starting point for future work. (Author)

The Application of Finite Elements and Space-Angle Synthesis to the Anisotropic Steady State Boltzmann (Transport) Equation.
Master's thesis,
Eze E. Wills. Mar 81, 174p Rept no. AFIT/GNE/PH/81-13

A finite element space-angle synthesis (FESAS) solution of the steady state anisotropic Boltzmann equation in a two-dimensional cylindrical geometry was developed. Starting from a variational principle the Bubnov-Galerkin solution method was applied to the second order even parity form of the Boltzmann equation. A trial function flux expansion in bicubic splines and spherical (surface) harmonics was used. A first scatter (collision) source and an exponentially varying atmosphere were also incorporated. FESAS was developed as an alternate solution approach and an improvement in comparison to the methods of Monte Carlo and discrete ordinates. FESAS does not have the inherent characteristics which have produced the ray effect problem in discrete ordinates; also, FESAS may result in lower computational costs. The second order even parity form of the Boltzmann equation was derived and shown to be symmetric, positive definite and self-adjoint. The equivalence of a variational minimization principle and the Bubnov-Galerkin method of weighted residuals was established. The FESAS system of equations was expanded and a numerical computer solution approach was implemented.

Stress Wave Interactions with Tunnels Buried in Well-Characterized Jointed Media.
Final rept. 4 May 77-1 Jun 80,
Martin Rosenblatt, and Larry A. DeAngelo. 1 Jun 80, 64p CRT-3170F, DNA-5334F
Contracts DNA001-77-C-0203, DNA001-79-C-0278

For the DIABLO HAWK underground nuclear test, several small-scale tunnels were constructed in jointed rock simulant material and stress loaded to approximately 0.8 kbar = 11.6 ksi. These tunnel response tests represented an opportunity to evaluate whether successful pre-shot predictions of tunnel closure and block motion could be made for tunnels buried in a well-characterized jointed media. In this report, numerical simulation predictions using computer code techniques which explicitly treat the idealized joints are described and compared to data from the recovered experimental model. The tunnel closure predictions and the predicted locations of block motion are in reasonable agreement with some experimental data. Other aspects of the study included: development and application of an analytical technique for predicting joint activation conditions (i.e., block motions) for specified joint orientations and locations near the tunnel surface, calculations and comparisons of tunnel response to dynamic and quasi-static stress loads, and investigation of the effects of joint friction on tunnel damage. Characterization of Starfish Striations from Analysis of Photographic Records.
Final rept. 1 May 78-31 May 79,
Walter F. Dudziak, and Pradip V. Lad. 30 Jun 79, 102p RM79ISI101, DNA-5065F
Contract DNA001-77-C-0170

The report summarizes the results of an extensive analysis in the frequency domain of photographic records that recorded, over Canton Island, the late time striations which resulted from the STARFISH nuclear detonation. The basis of this analysis are the frequency domain power spectral densities (PSDs) which were determined from relative optical radiances at various altitudes as a function of time. The analysis indicates how well the time/altitude variance of the power spectra can be represented by a simple analytic expression: (1) a log-log linear (power law) fit; (2) an exponential fit in the frequency domain. It has been found that both of the single simplified expressions underestimate the power at low frequencies. However, for a single simple expression, the log-log linear fit is a better representation of the data at very low frequencies. The report also synthesizes a value for the total number of striations, a radius probability distribution and the spatial area/volume contained within the striations from the exponential fit; (in this synthesis, the striations are assumed to have Gaussian electron density profiles). On this basis, a volume emission from the striated region is determined from which an estimate can be made on the on-axis striation electron density. (Author)

Nuclear Blast Program for Mini-Calculators.
Engineering rept.,
Rayford P. Patrick. 9 Mar 81, 16p Rept no. SAC/LGME-ER-S-111
Availability: Microfiche copies only.

A program has been written for the HP-97 (HP-67) minicomputer to solve the blast wave from a nuclear detonation. The program first determines standard-altitude parameters for the altitude of interest. Using these parameters as input, the program then calculates pressures, temperatures, densities, velocities, and Mach Numbers in front and behind the shock. Three subroutines allows the user to input (for any altitude < or = 82,000 ft) a specific overpressure across the shock, a specific gust velocity behind the blast wave, or a specific dynamic pressure behind the blast wave. Corresponding parameters for each input are calculated. (Author)

Time Domain Waveform Inversion of Short-Period P-Waves for Nuclear Explosion Source Time Functions.
Technical rept.,
Larry J. Ruff. 9 Jan 81, 43p SGI-R-80-034, AFOSR-TR-81-0495
Contract F49620-79-C-0012, ARPA Order-3291

This research investigates the estimation of the source time parameters of underground nuclear explosions from the waveforms of short-period teleseismic P-waves. In the simplest consideration, and when the source yield is unconstrained, there are only three source parameters, two that describe the source time function and one for the delay time of the (p)P phase. There are, of course, indications that the (p)P arrival may not have the same amplitude or shape as the direct P arrival, presumably due to anelastic or nonlinear effects between the shot point and the surface. Thus, we will also consider the effect on the waveforms of a decreased (p)P amplitude. Another parameter which has a significant influence upon the observed waveforms is t (t = travel time/Q(av). Accordingly, the variations in the source parameter estimates due to a varying t will also be addressed. (Author)

Angular and Energy Resolution of the DUMAND Optical Array.
V. J. Stenger, G. N. Taylor, and A. Roberts. 1978, 6p
Contract AC03-76ER00511

In an initial simulation of the response of the DUMAND optical array to the Cerenkov light from multi-TeV muons and hadronic cascades we find a muon angular resolution which is better than 15 mr above 10 TeV. The muon energy resolution is 60% at 5 TeV but improves to 45% and is approximately energy-independent above 10 TeV. The energy resolution of the hadronic cascade is given by delta E/sub H/ = 2.3 + .3E/sub H/ TeV. With these errors we can detect the presence of the W-boson propagator in deeply inelastic interactions induced by atmospheric neutrinos above 10 TeV in a few month's running with the currently conceived 1 km exp 3 array. Point sources of extraterrestrial neutrinos above a few TeV can be located to a fraction of 10 exp -5 of the celestial sphere. Multiple muon events induced in the upper atmosphere by primary cosmic rays can be studied with the possibility of measuring the invariant mass of any supermassive objects decaying into two muons. CAMAC Gamma Ray Scanning System.
C. E. Moss, J. C. Pratt, and E. R. Shunk. 1981, 30p

Contract W-7405-ENG-36

A flexible gamma-ray scanning system, based on a LeCroy 3500 multichannel analyzer and CAMAC modules, is described. The system is designed for making simultaneous passive and active scans of objects of interest to nuclear safeguards. The scanner is a stepping-motor-driven carriage; the detectors, a bismuth-germanate scintillator and a high-purity germanium detector. A total of sixteen peaks in the two detector-produced spectra can be integrated simultaneously, and any scan can be viewed during data acquisition. For active scanning, the 2615-keV gamma-ray line from a exp 232 U source and the 4439-keV gamma-ray line from exp 9 Be(alpha ,n) exp 12 C were selected. The system can be easily reconfigured to accommodate up to seven detectors because it is based on CAMAC modules and FORTRAN. The system is designed for field use and is easily transported. Examples of passive and active scans are presented. (ERA citation 06:021697)

An Approach to Seismic Zonation for Siting Nuclear Electric Power Generating Facilities in the Eastern United States.
Final technical rept. 28 Sep 78-28 Sep 80,
N. L. Barstow, K. G. Brill, Jr., O. W. Nuttli, and P. W. Pomeroy. May 81, 366p
Color illustrations reproduced in black and white.

Test sets of seismic versus non-seismic areas in the east and central United States are discriminated from each other, using multivariate statistics which select combinations of variables that classify the areas as seismic or non-seismic. Seventy percent of seismic test areas and 75 percent of non-seismic test areas are successfully classified using the variables: distance to a Pre-Triassic rift, number of faults, and number of fault/intrusive intersections. Better classification, however, is achieved when test areas are divided into regionally homogeneous subsets. For example, in the central U.S. 90.9% seismic and 78.6% non-seismic areas are correctly classified with the variables for: major arches and basins, gravity differential, and major rivers. These same variables are used to classify additional test areas in the central U.S., and the classifications for these correlate well with known seismicity. Ten seismic source zones in the central U.S. are independently delineated by a qualitative association of historical earthquakes with geologic features. Source zones are associated with basement rifts; e.g., New Madrid, basement faults, e.g., Colorado Lineament, and major uplifts and basins, e.g., Cincinnati Arch. These associations support the results of the statistically determined variables that distinguish seismic from non-seismic areas.

Hazards to Nuclear Power Plants from Nearby Accidents Involving Hazardous Material - Preliminary Assessment.
Technical rept.,
David E. Bennett, and Nancy C. Finley. May 81, 130p SAND-80-2334
Includes two sheets of 48X reduction microfiche.

This report describes a preliminary or scoping assessment of the vulnerability of commercial, light water reactor (LWR) plants to the effects of nearby, but offsite, accidents involving hazardous materials. The hazardous environments resulting from these accidents could degrade or threaten the safe operation or safe shutdown capability of the plant. This assessment is the initial part of a program to develop a comprehensive methodology for evaluating the effects of such accidents. Transportation accidents (road, rail, pipeline, etc.) and accidents at fixed storage facilities are considered, with the principal emphasis on transportation accidents. The current regulations covering the safety analysis for hazardous materials accidents are reviewed.

Licensed Operating Reactors. Volume 5, Number 5. Data as of May 30, 1981.
Status summary rept.
Jun 81, 164p
See also Volume 5, Number 3, NUREG-0020-V5-N3.

The Operating Units Status Report - Licensed Operating Reactors provides data on the operation of nuclear units as timely and accurately as possible. This information is collected by the Office of Management and Program Analysis from the Headquarters staff of NRC's Office of Inspection and Enforcement, from NRC's Regional Offices, and from utilities. The three sections of the report are: monthly highlights and statistics for commercial operating units, and errata from previously reported data; a compilation of detailed information on each unit, provided by NRC's Regional Offices, IE Headquarters and the utilities; and an appendix for miscellaneous information such as spent fuel storage capability, reactor-years of experience and non-power reactors in the U.S. It is hoped the report is helpful to all agencies and individuals interested in maintaining an awareness of the U.S. energy situation as a whole.

Nuclear Plant Standardization: Light Water Reactors,
Apr 81, 75p OTA-E-134

This report evaluates the extent to which nuclear powerplants can and should be standardized. The assessment provides the essential background material for a broad understanding of the nuclear industry, its institutions and their relationship to standardization. Items presented in the report include specific examples of the current state of nu-

clear powerplant standardization, and four different concepts of standardization and their potential impact on safety. These concepts represent a wide range of approaches toward standardization and would entail greatly differing requirements for industry and regulators as well as differing implications for safety.

New Aspects in the Evaluation of Thermal Neutron Cross Sections.
S. F. Mughabghab. 1980, 32p CONF-800979-16
Contract AC02-76CH00016
Workshop on nuclear data evaluation methods and procedures, Upton, NY, USA, 22 Sep 1980.

Because of recent advances in experimental techniques, which improved the accuracies of thermal capture and scattering cross sections by an order of magnitude, a more stringent approach in the evaluation of the thermal constants is developed. In the present approach, the following aspects are introduced: (1) a consistency between thermal cross sections, coherent and incoherent scattering lengths, and neutron resonance parameters is achieved; (2) a consistency between the isotopic and element cross sections is sought; in addition, for each isotope, the requirement that the partial cross sections add up to the total is fulfilled; (3) where possible, charged particle data particularly derived from (d,p) reactions on light and medium weight isotopes are used in locating the positions and strengths of bound levels. Such a procedure is useful in the evaluation of the shape of the cross sections in the thermal region; and (4) the Lane-Lynn theory of direct capture is called upon to calculate thermal cross sections and check ior consistencies for certain isotopes. Extensive examples to illustrate these procedures are presented. (ERA citation 06:022858)

Momentum Exchange by Photons in an Absorbing and Scattering Medium.
A. L. Edwards. 10 Jun 81, 14p UCID-19064
Contract W-7405-ENG-48
Microfiche only after original copies are exhausted.

This report summarizes the equations for exchange of linear momentum between photons and an absorbing and scattering medium. Mechanisms are not discussed, but are represented by given cross sections. Momentum exchange at discrete points, and continuously along straight line segments are discussed. Equations are given for cartesian coordinates, the radial and axial coordinates in cylindrical geometry, and the radial coordinate in spherical geometry. A general class of energy and momentum exchange methods is discussed, and useful approximations given for the radial component of linear momentum deposition. (ERA citation 06:024512)

Alternate Nuclear Waste Forms and Interactions in Geologic Media.
L. A. Boatner, and G. C. Battle, Jr. Apr 81, 396p
Alternate waste form information workshop, Gatlinburg, TN, USA, 13 May 1980.

The primary purposes of the conference on Alternate Nuclear Waste Forms and Interactions in Geologic Media were: First, to provide an opportunity for a review of the status of the research on some of the candidate alternative waste forms; second, to provide an opportunity for comparing the characteristics of alternate waste forms to those of glasses; and third, to stimulate increased interactions between those research groups that were engaged in a more basic approach to characterizing waste forms and those who were concerned with more applied aspects such as the processing of these materials. The motivating philosophy behind this third purpose of the conference was based on the idea that by operating from the soundest possible fundamental base for any of the candidate waste forms, hopefully any future unpleasant surprise - such as that alluded to earlier in the case of glass waste forms - could be avoided. Separate abstracts have been prepared for individual papers for inclusion in the Energy Data Base. (ERA citation 06:021653)

Conceptual Aspects of Fiscal Interactions Between Local Governments and Federally-Owned, High-Level Radioactive Waste-Isolation Facilities.
D. J. Bjornstad, and K. E. Johnson. 1981, 30p
Contract W-7405-ENG-26
Annual meeting of Southern Regional Science Association, Washington, DC, USA, 14 Apr 1981.

This paper examines a number of ways to transfer revenues between a federally-owned high level radioactive waste isolation facility (hereafter simply, facility) and local governments. Such payments could be used to lessen fiscal disincentives or to provide fiscal incentives for communities to host waste isolation facilities. Two facility characteristics which necessitate these actions are singled out for attention. First, because the facility is federally owned, it is not liable for state and local taxes and may be viewed by communities as a fiscal liability. Several types of payment plans to correct this deficiency are examined. The major conclusion is that while removal of disincentives or creation of incentives is possible, plans based on cost compensation that fail to consider opportunity costs cannot create incentives and are likely to create disincentives. Second, communities other than that in which the facility is sited may experience costs due to the siting and may, therefore, oppose it. These costs (which also accrue to the host community) arise due to the element of risk which the public generally associates with proximity to the transport and storage of radioactive materials. It is concluded that under certain circumstances compensatory payments are possible, but that measuring these costs will pose difficulty. (ERA citation 06:023199)

TRW Energy Systems Planning Div., McLean, VA.
Economics of Mined Geologic Repositories.
J. D. Forster. Dec 79, 122p ONWI-93
Contract AC06-76RL01830
Microfiche only after original copies are exhausted.

The purpose of this study was to estimate the effects on total cost and unit cost of several major alternatives relating to commercial nuclear waste geologic repositories. The study is in three parts: a review of recent studies, cost uncertainty analyses, and a parametric analysis. The review of recent studies brings together the major economic results of six repository design studies. The recent studies indicate that unit costs for repositories in salt media are the lowest regardless of waste form. However, waste form minimum unit costs varied from media to media. Repository cost uncertainties are categorized as cost component uncertainties, design/scope uncertainties, and economic uncertainties. Each type is discussed qualitatively. An estimate of the magnitude of each type of uncertainty is developed based on the assumption that a nuclear waste repository will experience a similar cost growth pattern to that experienced with other large non-military government funded projects. These estimates of project uncertainty contributions rank design/scope uncertainties highest, economic uncertainties second, and cost component uncertainties lowest. The parametric analysis used the existing National Waste Terminal Storage Economic Evaluation Model to evaluate the effects of key variables on the cost of a baseline repository scenario. Mining methods (advance versus retreat mining, boring versus drum mining machines) were found to play a key role in repository economics. The principal conclusions of this report are that nuclear waste repository cost uncertainties can be expected to be quite large. Reasonable variations in the individual parameters which characterize a repository, however, cause only moderate cost effects. The potential effects of variations in regulatory policy were not quantified and could not be included in the parametric analysis. (ERA citation 06:023206)

Decontamination Processes for Waste Glass Canisters.
W. N. Rankin. 1981, 35p CONF-810606-37
Contract AC09-76SR00001
American Nuclear Society's annual meeting, Miami Beach, FL, USA, 7 Jun 1981.

The process which will be used to decontaminate waste glass canisters at the Savannah River Plant consists of: decontamination (slurry blasting); rinse (high-pressure water); and spot decontamination (high-pressure water plus slurry). No additional waste will be produced by this process because glass frit used in decontamination will be mixed with the radioactive waste and fed into the glass melter. Decontamination of waste glass canisters with chemical and abrasive blasting techniques was investigated. The ability of a chemical technique with HNO sub 3 -HF and H sub 2 C sub 2 O sub 4 to remove baked-on contamination was demonstrated. A correlation between oxide removal and decontamination was observed. Oxide removal and, thus, decontamination by abrasive blasting techniques with glass frit as the abrasive was proposed and demonstrated. (ERA citation 06:023202)

Low-Level-Waste-Disposal Methodologies.
M. L. Wheeler, and K. Dragonette. 1981, 13p
CONF-810606-36
Contract W-7405-ENG-36
American Nuclear Society's annual meeting, Miami Beach, FL, USA, 7 Jun 1981.

This report covers the followng: (1) history of low level waste disposal; (2) current practice at the five major DOE burial sites and six commercial sites with dominant features of these sites and radionuclide content of major waste types summarized in tables; (3) site performance with performance record on burial sites tabulated; and (4) proposed solutions. Shallow burial of low level waste is a continuously evolving practice, and each site has developed its own solutions to the handling and disposal of unusual waste forms. There are no existing national standards for such disposal. However, improvements in the methodology for low level waste disposal are occurring on several fronts. Standardized criteria are being developed by both the Nuclear Regulatory Commission (NRC) and by DOE. Improved techniques for shallow burial are evolving at both commercial and DOE facilities, as well as through research sponsored by NRC, DOE, and the Environmental Protection Agency. Alternatives to shallow burial, such as deeper burial or the use of mined cavities is also being investigated by DOE. (ERA citation 06:021672)

Characteristics of Wastes and Soils Affecting Transport of Radionuclides Through the Soil and Their Relationship to Waste Management: Annual Report FY '79.
Progress rept.,
Eric B. Fowler, Wilfred L. Polzer, and Edward H. Essington. May 81, 40p LA-8563-PR

Investigations of waste/soil interactions have continued. Studies on the attenuation of plutonium species, uranium species, 241Am and 137Cs by four different soils for two different wastes have been completed. The degree of attenuation for a specific radionuclide varies among soils. A specific soil attenuates different radionuclides to different degrees; 137Cs is attenuated to the highest degree by all soils. Soils from the Ap and A2 horizon of a South Carolina Fuquay soil when reacted with waste dissolve plutonium, americium, iron, and aluminum from the insoluble fraction of the waste. The dissolved plutonium and americium are not sorbed by the soil thus are potentially mobile and are considered to be complexed, possibly by an organic chelate from the soil metabolic pool. When the degrees of sorption for horizon soils from Fuquay and Fayette soil profiles are compared, the ability to solubilize was found to be unique to the Fuquay Ap and A2. The lower horizons, B2t and C, of the Fuquay soil have a high sorptive capacity for all of the radionuclides studied. Emphasis will be placed on a field study in FY '80 at the Maxey Flats, Kentucky shallow land burial site. Soil solution samples will be obtained at various depths and locations using porous cups. Soil will be obtained for analyses from the same locations. Sampling of the soil solutions will provide data relative to the presence and concentration of mobile radionuclides. Dr. Robert Schulz, University of California, Berkeley, will implant electric soil moisture sensors for the determination of soil moisture movement. Those data will be correlated with results from chemical, physical, and radiochemical analyses.

Distribution Coefficients for Radionuclides in Aquatic Environments. Volume 5. Adsorption and Desorption Studies of Plutonium and Americium.
Topical rept.,
A. L. Sanchez, W. R. Schell, and T. H. Sibley. Jun 81, 77p
See also Volume 1, NUREG/CR-1852-V1.

The distribution coefficents of two important transuranic elements, plutonium and americium, were measured experimentally in several freshwater, estuarine, and marine systems to evaluate the magnitude of their interactions with sediments. The Kd values for sorption of these radionuclides ranged from 1,000 to 1,000,000 ml/g in all the sediment-water systems studied, in agreement with their Kd values reported in the literature. Significant differences between the Kd values obtained for different experimental systems suggest that the amount of Pu and Am removed by sediment particles depends on the sediment type and the water composition. The Kd for desorption of the radionuclides was measured and found to be considerably greater than the sorption Kds in most cases. This indicates that the radionuclide-sediment interactions were not completely reversible under the experimental conditions. The effects of pH and sediment concentration on the Kd values were also investigated. There were significant changes in the Kd values as these parameters were varied. Experiments using sterilized and non-sterilized samples were conducted for some of the sediment-water systems to evaluate possible bacterial effects on Kd. Finally, dialysis experiments were performed to determine the relative importance of suspended sediments, organic detritus, and phytoplankton in removing these radionuclides from both fresh and marine waters.

Distribution Coefficients for Radionuclides in Aquatic Environments: Adsorption and Desorption Studies of 244Cm.
Topical rept.,
E. A. Wurtz, T. H. Sibley, and W. R. Schell. Jun 81, 31p
See also Volume 4, NUREG/CR-1852-V4.

Although little information is available for comparison, the adsorptive properties of curium and americium in natural aquatic environments are expected to be similar due to their nearly identical physical and chemical properties. This study measures curium adsorption distribution coefficients for sediment-water samples collected from the Hudson River, its estuary and Cattaraugus Creek, New York, and curium desorption distribution coefficients for the Hudson River. The effect of sediment concentration and pH on adsorption was determined. The results are compared to results obtained for americium reported by Sanchez et al. utilizing the same sediment-water samples.

Study on the Environmental Impact of the Conversion of Plutonium Nitrate Coming from the Reprocessing of Mixed Oxide Fuel Instead of Uranium Fuel.
Final rept.,
c1980, 131p EUR-6829-EN, ISBN-92-825-1866-3
Customers in the European Community Countries should apply to the office for official publications of the European Communities, B. P. 1003, Luxembourg.

The effect on the environment of a plant for the conversion of plutonium nitrate, originating from mixed oxide fuel rather than uranium fuel, is assessed for a throughput of 5 kg of plutonium per day in batch-type operation. It is concluded that present safety techniques at the plant when second generation plutonium is used, are sufficient to safeguard the environment. Use of Geohydrologic Response Functions in the Assessment of Deep Nuclear Waste Repositories: Assessment of Effectiveness of Geologic Isolation Systems.
R. W. Nelson. May 81, 53p
Contract AC06-76RL01830

Geohydrologic Response Functions (GRFs) interrelate the three vital factors needed in the repository decision-making process: the quantity, arrival time, and location of contamination reaching the biosphere. GRFs further focus attention upon two related and additive parameters: the initial delay time and delay spread time. After the principal site selection, the GRFs may be applied to obtain more detailed performance evaluations concerning specific nuclides or waste components, specific results for various types of accidental release, and effects of a variety of contaminant source terms or leach models. The response functions may be applied to consider contaminant reductions and delays through material sorption as well as through a variety of other interactions and effects. (ERA citation 06:021692)

A Multiburst Fallout Model for Operational Type Studies.
Master's thesis,
John F. Crandley, Jr. Mar 81, 86p Rept no. AFIT/GST/PH/81M-1

A method is developed for calculating fallout deposition down-wind from a massive nuclear attack on a small target area over a short time span. This is accomplished using existing smear codes and replacing their existing horizontal activity distribution with an approximating function. This function is the difference between two cumulative normal functions which are shown to result from superposition of individual bursts. A comparison is made between the contours predicted by this new code and contours predicted by the old, time-consuming, iterative procedures. The new code has been employed in several different scenarios involving the proposed MX field to determine the resulting dose contours from a massive attack against that field. (Author)

X-Ray Fluence and Transmission and Prompt Radiation Fluence or Dose.
Master's thesis,
Donald Edwin Jones. Mar 81, 85p Rept no. AFIT/GNE/PH/81M-5

This report is to validate and evaluate a Horizons Technology Inc. (HTI) TI-59 program written to calculate the free field x-ray fluence from a nuclear burst. In addition to this validation of an existing program, programs were written to compute mass integral and prompt radiation effects. X-ray transmission is calculated using a build-up factor method and is compared to results from the HTI program. Results are compared for black-body temperatures of 0.1, 1.0, and 10.0 keV and mass integrals from 0.000001 to 10.0gm/sq.cm. The results compare well with a maximum error of approximately 21%. HTI's program has a minor problem as the transmission factor approaches zero so a TI-59 program is provided for use in that regime. A quick FORTRAN program is provided to calculate the fluence reaching a receiver. TI-59 and

FORTRAN programs are given to calculate the mass penetrated and prompt radiation fluence or dose. (Author)

Environmental Measurements Laboratory Annual Report, Calendar Year 1980.
H. L. Volchok. May 81, 99p

The 1980 Annual Report is presented as a series of abstracts, organized by broad programmatic headings under the five technical Laboratory Divisions and one Branch. In addition, a short section appears at the end of the report describing the organization, staff, outside activities and our publications and presentations for the year. Research performaed by the Environmental Studies Division is reported under the following categories: high altitude sampling program, deposition and surface air, and the biosphere. Measurement methods research and air quality field studies are reported by the Aerosol Studies Division. The Radiation Physics Division reported research on radiation transport theory, radiation dosimetry, environmental radioactivity, and the assessment of non-nuclear energy technologies. Research in the Analytical Chemistry Division is reported on quality assurance, analytical support of research projects, analytical development for research projects, and programmatic research. The Instrumentation Division reported research on the development of instrumentation in various categories. The Applied Mathematics Branch reported results of programs for aerosol studies, analytical chemistry, environmental studies, and radiation physics. (ERA citation 06:022672)

Contract AC15-76CL02395
110. annual meeting of the AIME, Chicago, IL, USA, 22 Feb 1981.

The cell liner concept used in the design of liquid metal fast breeder reactors has the dual function of preventing inert gas leaks between the cells and preventing excessive damage to the concrete, to which the liners are attached, in the event of a hot sodium spill. The design of the liners has to be based on accurate material property data applicable under all conditions (operating and post-fault) of cell liner operation. Normal operating conditions include temperatures up to 65 exp 0 C but the effects of a high-temperature (up to 590 exp 0 C) sodium spill have been estimated to result in temperatures as high as 927 exp 0 C due to possible exothermic reactions. The steel specified for most cell liners is SA 516 (Grade 55) which is a carbon steel of pressure vessel quality. The mechanical property data available on this material and weldments of it are mostly limited to temperatures of 593 exp 0 C and below. A program was initiated to obtain the required short term tensile properties, as a function of strain rate and temperature, and limited creep rupture properties. All the tests were to be performed in air due to the unfeasibility of trying to duplicate the environmental possibilities which can occur during a sodium spill. The tensile and creep property data on the weldment are reported. (ERA citation 06:023524)

A nuclear power plant must be designed to ensure that the consequences of a pipe break will be mitigated. Jet deflectors must be included to prevent damage to safety and control systems. Current NRC models used for two-phase jet load calculations seem to be overly conservative in many cases. The objective of the two-phase jet loads program is to develop an approximate engineering model which better describes the process. This model will be based on experimental data and calculations from multi-dimensional codes. During this past quarter, the effort in this program has been directed toward, (A) Detailed CSQ calculations were performed for the first Marviken free-jet blowdown. (B) Guard pipe calculations were performed and a summary letter delivered to NRC/NRR. (C) Development continued on a fast running, finite difference code for analyzing jet impingement.

Contract DE-AC09-76SR00001

A modular computational system known as the Water Reactor Analysis Package-Evaluation Model (WRAP-EM) has been developed for the Nuclear Regulatory Commission (NRC) to interpret and evaluate reactor vendor EM methods and computed results. A subset of the system (WRAP-BWR-EM) provides the computational tools to perform a complete analysis of loss-of-coolant accidents (LOCAs) in boiling water reactors (BWR). A series of calculations modeling tests run on the General Electric Two Loop Test Apparatus, and calculations of a large break in a BWR/4 and BWR/6 plant have verified that the WRAP-BWR-EM system is functioning as intended. Additional calculations using a BWR/6 reference design were run as part of another study to determine the sensitivity of calculated system parameters to code input and the selection of calculational options available.

Analysis of the first small break loss-of-coolant accident (LOCA) heat transfer test series was completed. The second small break LOCA heat transfer test series, consisting of 16 tests, was conducted. Analysis of the second transient film boiling test produced results consistent with those of the first such test - the Dougall-Rohsenow film boiling correlation substantially overpredicts the heat transfer. A series of steady-state film boiling tests and a third transient film boiling test were conducted. Initial evaluation of the in-bundle gamma densitometer system reveals anomalous results when fluid temperature exceeds 589 K (600F).

An Assessment of the Failure Rate for the Beltline Region of PWR Pressure Vessels during Normal Operation and Certain Transient Conditions.
Technical rept.,
R. M. Gamble, and J. Strosnider, Jr. Jun 81, 93p

A study was conducted to assess the failure rate for the beltline region of a generic pressurized-water reactor (PWR) pressure vessel. This assessment included the evaluation of several normal operating and transient reactor conditions. Failure rates were calculated from a computer code that used fracture mechanics methods to model the failure process; random number generation techniques were used to simulate random variables and model their interaction in the failure-process. This investigation had three major objectives: (1) to better define the effect of neutron irradiation, material variation, and flaw distribution on the failure rate for the beltline region of PWR pressure vessels, (2) to estimate the relative margins against failure for normal operation and certain transient conditions associated with nuclear pressure vessels, and (3) to evaluate the current limitations for using fracture mechanics models to predict failure rates for nuclear pressure vessels.

Text in German.
Customers in the European Community Countries should apply to the office for official publications of the European Communities, B. P. 1003, Luxembourg.

The aim of this study was the comparison of the nuclear safety characteristics and performance of LWR with uranium fuel and MOX fuel. For PWR the stationary evaluations include the transitions from the equilibrium U core to equilibrium cores loaded partly and completely with MOX fuel. For BWR the equilibrium uranium cycle and the cycles with 100% and 25% MOX cores were considered. Detailed fuel management calculations show for the MOX cores the same power peaking as for the uranium cores. Altogether, the stationary evaluations for both reactors show no serious problems concerning the plutonium recycling.

Summary of the Hydraulic Evaluation of LWBR (LWBR Development Program).
J. W. Stout, S. Lerner, K. D. McWilliams, and J. R. Turner. Apr 81, 98p
Contract AC11-76PN00014

The principal hydraulic performance features of the Light Water Breeder Reactor are summarized in this report. The calculational models and procedures used for prediction of reactor flow and pressure distributions under steady-state and transient operating conditions are described. Likewise, the analysis models for evaluation of the static and dynamic performance characteristics of the hydraulically-balanced and hydraulically-buffered movable-fuel reactivity-control system are outlined. An extensive test program was conducted for qualification of the subject LWBR hydraulic evaluation models. The projected LWBR hydraulic performance is shown to fulfill design objectives and functional requirements. (ERA citation 06:022042)

Evaluation of Multiparameter Eddy Current Technology for Inspection of Steam Generator Tubing,
S. D. Brown. Mar 81, 86p BNL-NUREG-51347
Contract DE-AC02--76CH00016
Prepared in cooperation with Battelle Columbus Labs., OH.

Multifrequency/multiparameter eddy current instrumentation for inspection of steam generator tubing has recently become commercially available. The instrumentation offers the steam generator owner a means to conduct parallel tests, i.e., normal tube integrity tests, sludge profiling and dent sizing in one pull through the tube. In addition, the real time suppression of extraneous variables such as support plates, denting and ID noise can be accomplished. The intercontrole 1C3FA multiparameter instrument has been used for an assessment of multiparameter technology to detect and characterize defects in the presence of extraneous variables. A general mixing sequence has been developed which is applicable to both recirculating steam generators (RSG) and once-through steam generators (OTSG). Candidate mixing frequencies have been identified through the use of a computer program which models the 1C3FA sequential mixing network. Using appropriate models of defects at support plates and dented support plates, multiparameter technology has been found to offer advantages over single frequency approaches for more reliable defect detection and characterization.

'In vitro' Dissolution of Respirable Aerosols of Industrial Uranium and Plutonium Mixed-Oxide Nuclear Fuels.
Technical rept.,
Arthur F. Eidson, and James A. Mewhinney. May 81, 21p LMF-79

Dissolution characteristics of mixed-oxide nuclear fuels are important considerations for a prediction of biological behavior of inhaled particles. Four representative industrial mixed-oxide powders were obtained from fuel fabrication enclosures. Studies of the dissolution of Pu, Am and U from aerosol particles of these materials in 0.1 M HCl, and a serum simulant solution showed: (1) dissolution occurred at a rapid rate initially and slowed at longer times, (2) greater percentages of U dissolved than Pu or Am, (3) the temperature history of industrial mixed-oxides did not appreciably alter dissolution rates except when Pu or Am were incorporated into a solid solution by sintering at 1750C, and (4) the serum simulant results agreed with the in vitro behavior of PuO2 and UO2 and 0.1 M HCl results agreed with available in vivo results for inhaled solid solution aerosols. The rapid early dissolution rate was shown to be related to an altered surface layer. Advantages and uses of in vitro solubility data for estimation of biological behavior of inhaled industrial mixed-oxides such as assessing the use of chelation therapy and interpretation of urinary excretion data are discussed. It was concluded that in vitro solubility tests were useful, simple and easily applied to individual materials potentially inhaled by humans.

Catalogue of Chemical and Isotopic Nuclear Reference Materials,
Y. Le Duigou. c1980, 46p EUR-6937-EN, ISBN-92-825-2014-5
Prepared in cooperation with Joint Research Center, Geel Establishment (Italy). Central Bureau for Nuclear Measurement.
Customers in the European Community Countries should apply to the office for official publications of the European Communities, B. P. 1003, Luxembourg.

The present catalogue is a revised version of the C.B.N.M. report EUR 5229e entitled 'Catalogue of Reference Materials of Interest to Nuclear Energy' (1974). An attempt has been made to give in this catalogue the present status of available chemical, isotopic and trace element reference materials of interest to nuclear energy. Emphasis has been given to the substances of primary interest like those containing uranium and plutonium. In this catalogue the materials are presented according to the sequence of the atomic number of the element of major interest. This inventory, no doubt, includes errors and omissions. An update and completion of the catalogue is foreseen within three years time. (Copyright (c) ECSC-EEC-EAEC, Brussels and Luxembourg,1980.)

The Differential Radiological Impact of Plutonium Recycle in the Light-Water Reactor Fuel Cycle: Effluent Discharges during Normal Operation.
Final rept.,
A. Bouville, P. Guetat, J. A. Jones, G. N. Kelly, and J. Legrand. c1980, 148p EUR-6992-EN, ISBN-92-825-2092-7
Customers in the European Community Countries should apply to the office for official publications of the European Communities, B. P. 1003, Luxembourg.

The radiological impact of a light-water reactor fuel cycle using enriched uranium fuel may be altered by the recycle of plutonium. Differences in impact on the population of the European Communities (EC) from effluents discharged during normal operation are evaluated for the specific case of recycling 10 tons of fissile plutonium metal. The contributions from each stage of the fuel cycle, i.e. fuel fabrication, reactor operation, and fuel reprocessing and conversion, are identified. Separate consideration is given to airborne and liquid effluents, and account is taken of a wide range of environmental conditions, representative of the EC, in estimating the radiological impact. Recycling of plutonium is estimated to result in a reduction in the radiological impact from effluents of about 30% compared with using enriched uranium fuel. (Copyright (c) ECSC-EEC-EAEC, Brussels . Summary of the Thermal Evaluation of LWBR (LWBR Development Program).
S. Lerner, K. D. McWilliams, J. W. Stout, and J. R. Turner. Mar 80, 78p
Contract AC11-76PN00014

This report describes the thermal evaluation of the core for the Shippingport Light Water Breeder Reactor. This core contains unique thermal-hydraulic features such as (1) close rod-to-rod proximity, (2) an open-lattice array of fuel rods with two different diameters and rod-to-rod spacings in the same flow region, (3) triplate orifices located at both the entrance and exit of fuel modules and (4) a hydraulically-balanced movable-fuel system coupled with (5) axial-and-radial fuel zoning for reactivity control. Performance studies used reactor thermal principles such as the hot-and-nominal channel concept and related nuclear/engineering design allowances. These were applied to models of three-dimensional rodded arrays comprising the core fuel regions. (ERA citation 06:022041)

Dosimetry Characterization of a Reactor Pressure Vessel Simulator by Fission Chamber and Foil Activation Measurements.
Final rept.,
E. D. McGarry, and A. Fabry. 1980, 11p
Pub. in Proceedings of ASTM-Euratom Symp. Reactor in Dosimetry Methods for Fuels, Cladding and Structural Materials (3rd), EUR6813 EN-FR, II, p1031-1041 1980.

A summary is given of the significance and results of extensive dosimetry measurements in the low-power, Light-Water Reactor Pressure Vessel (RPV) Simulator at the Pool Critical Assembly. Calculated and measured neutron flux and spectral characteristics are compared for a RPV simulator that represents a clean-core calculational model with measured core-power distributions. The purpose of such a model is to validate transport theory computations needed to extrapolate into the pressure vessel dosimetry observations in the surveillance position. Also reported are investigations of the neutron field characteristics of other configurations, which were investigated to establish the design of a high-power RPV simulator to proof test the correlation of metallurgy and dosimetry results.

Environmental and Radiological Safety Studies. Interaction of exp 238 PuO sub 2 Heat Sources with Terrestrial and Aquatic Environments. Progress Report, October 1-December 31, 1980.
G. R. Waterbury. Apr 81, 45p
Contract W-7405-ENG-36

The containers for exp 238 PuO sub 2 heat sources in radioisotope thermoelectric generators are designed with large safety factors to ensure that they will withstand reentry from orbit and impact with the earth and safely contain the nuclear fuel until it is recovered. Existing designs have proved more than adequately safe, but the Space and Terrestrial Division of the Department of Energy Office of Advanced Nuclear Systems and Projects continually seeks more information about the heat sources to improve their safety. The work discussed here includes studies of the effects on the heat source of terrestrial and aquatic environments to obtain data for design of even safer systems. The data obtained in several ongoing experiments are presented; these data tables will be updated quarterly. Discussions of experimental details are minimized and largely repetitive in succeeding reports. Compilations of usable data generated in each experiment are emphasized. These compilations include data from environmental chamber experiments that simulate terrestrial conditions, experiments to measure PuO sub 2 dissolution rates, soil column experiments to measure sorption of plutonium by soils, and several aquatic experiments. (ERA citation 06:021691)

The Effects of C/M Ratio on the Controlled Fragmentation of Cylinders Using External Notching.
David S. Saunders. Dec 80, 34p Rept no. MRL-R-800

The effects of C/M (HE charge to cylinder mass) ratio on the degree of control of fragmentation exerted by external longitudinal notching are investigated. Two series of experiments are conducted. In one series the cylinder wall thickness is varied to induce weight scaling and in the other both the cylinder dimensions and notch pitching are varied to induce number scaling. Although both weight and number scaling with C/M ratio are feasible for notched cylinders, the results demonstrate that there are limitations to the degree of control exerted by the notching. Both weight and number scaling appear to be limited by the propensity for the operation of natural fragmentation mechanisms between the notches and weight scaling is also limited by geometric factors. The filling of the notches with an epoxy resin produces an increase in the degree of control of fragmentation for both weight and number scaling cylinders. (Author)

A Consumable Case for Artillery Systems.
Memorandum rept.,
J. J. Rocchio, C. R. Ruth, I. W. May, K. J. White, and I. Nadel. Mar 81, 72p ARBRL-MR-03086, AD-E430 630

The inherent lack of rigidity and the complexity of bagged propelling charges and the associated ignition components can lead to incorrect alignment and/or assembly of the charge. A well-designed consumable case can alleviate these problems by assuring ignition system alignment and control of charge location within the chamber while simplifying the fabrication of the charge. A howitzer prototype consumable case was fabricated from available felted nitrocellulose components and test firings were conducted. Three types of ignition systems were tested: a base pad and centercore snake of black powder (as used in the M203 Propelling Charge), a centercore snake alone (113 g Class 5 black powder), and an igniter constructed of 113 g of Class 5 black powder placed in three 1-cm diameter plastic tubes within the centercore tube. The results indicated: 1) the consumable case gave performance comparable to the M203 charge; 2) the base pad/snake igniter gave larger pressure waves than the two types of centercore igniters alone; 3) the igniter system based upon the plastic tubes gave the best performance; and 4) there was no significant increase in residue with the consumable case. The rigidity of a consumable case and the precision of the manufacturing process should eliminate the persistent problems (e.g., ignition delay, pressure waves, velocity variation, etc.) which are the result of the misalignment of critical ignition train components and poor tolerances inherent to bagged charges. Therefore, major benefits of a consumable case should be improved safety and precision as well as good automatic handling and loading characteristics.

Measurements of Dynamic Stress and Strain Components in Targets Struck by Penetrators.
Memorandum rept. Jun 77-Jun 79,
Dennis S. Pritchard. Mar 81, 34p ARBRL-MR-03095, AD-E430 621

Stress and strain profiles have been recorded in targets impacted by long-rod kinetic-energy projectiles. Stress gauge records were strongly influenced by the strain field in the target, so compensating strain measurements were used to derive the correct stress profile. Strain-compensated stress gauges in the projectile path measured stress which increased to a value that remained nearly constant until penetration neared the gauge. This constant stress was close to the value of the Hugoniot Elastic Limit of the target material.

Measurement of Critical Diameter, Shock and Impact Sensitivity of a Special Propellant.
Final rept. Jan 78-May 79,
W. H. Andersen, D. L. Aldrich, Frieda L. Gillespie, G. P. Stillman, and Jan Y. Wong. Mar 81, 60p 3460-12, ARBRL-CR-00448, AD-E430 634
Contract DAAK11-78-C-0019

The results of an experimental investigation of the critical diameter, and shock and impact sensitivity of the LOVA-X1A propellant are described. The detonation velocity was determined as a function of charge diameter for the propellant. The critical diameter lies between 0.245 and 0.375 in. for the bare charge. The shock sensitivity for initiating detonation in the propellant was determined by a gap test technique. The results, together with the results of projectile impact tests on solid disks of the propellant determined earlier, are discussed and examined in terms of the sensitivities of materials given in the literature. The critical initiating shock pressure and critical ignition energy are estimated. It is shown that the LOVA-X1A propellant is relatively insensitive to initiation compared to most cast explosives and propellants in use today. The sensitivity of stacked small grains of the propellant to projectile impact was also determined. The tests showed that the response of the grains at a large projectile diameter was always deflagration; whereas at small diameters no sustained reaction was produced. No detonation was produced by the impact. Recommendations for additional studies are given.

Measurement of Pressure and Related Energy Output from Thermally Ignited Pyrotechnic Compositions Burning in a Partially Vented Vessel.
Technical rept.,
Patricia L. Farnell, Leroy Hunter, and Francis R. Taylor. May 81, 70p ARLCD-TR-81006, AD-E400 621

In an effort to determine the hazards of preparing pyrotechnic compositions in processing bays, a study was conducted in which a series of compositions were thermally ignited in a vented vessel and the resulting pressure versus time, rate of pressure rise, and velocity of the air pressure wave were measured. The compositions were a standard illuminating material, a photoflash powder, an igniter, a delay powder, and a formulation which generates IR radiation. These experiments showed that the pressure increased linearly with (a) increasing loading density for a constant vent, and (b) decreasing vent size for constant loading density. For the linear part of the pressure-time trace, rate of pressure rise also increased with increasing loading density and with decreasing vent size. This latter result shows the effect of pressure on burning rate. Velocities of the air pressure wave were obtained in excess of the speed of sound, indicating a low velocity detonation had taken place. Very low TNT equivalences for pressure were obtained, the largest being only 0.61; those for impulse were 0.6 through 0.9 with the smallest vent for the compositions (except the gasless delay powder which was only 0.05), reflecting the relatively long duration of positive pressure produced by these compositions.

Classification of Liquid Gun Propellants and Raw Materials for Transportation and Storage.
Contract rept.,
William J. Cruice. May 81, 40p ARBRL-CR-00454, AD-E430 636
Contract DAAK11-78-C-0024

Nine materials have been tested and classified on the basis of the military explosive classification system as described in Department of the Army Technical Bulletin C1, TB 700-2. Since the test methods described in TB 700-2 are designed for solids, rather than liquids, a test program was designed in which nine tests (relating specifically to unique problems and situations encountered in the liquid phase) were substituted for the specified TB 700-2 tests. Where the originally proposed tests were considered to be overly rigorous, additional tests were performed to better simulate the TB 700-2 protocol. Concordance of the tests with those described in TB 700-2 was described, and a testing protocol was developed. This protocol was applied to the classification of the nine materials and each material was classified according to the TB 700-2 classification scheme. The three fuels (IPAN, TMAN, TEAN) and the three oxidizers (HAN 2.8 M, 11 M, 13 M) were considered unrestricted under TB 700-2; LGP 1776, LGP 1845 and NOS 365 were classified Military Class 3 (DOT Class B).

U.S. (ARRADCOM) Test Results for NATO Round-Robin Test on High Explosives.
Technical rept.,
L. Avrami, and M. S. Kirshenbaum. May 81, 59p ARLCD-TR-81010, AD-E400 628

As part of the NATO Round-Robin Test program using explosives from one source, the US (ARRADCOM) performed a series of tests on five BICT-furnished explosives. The explosives tested were PETN, RDX, HMX, tetryl and TNT. A series of impact tests were conducted utilizing the 50% Bruceton, the Picatinny Arsenal 10% point and the full run-down test methods. Additional tests, including melting point, chemical analysis, vacuum stability test, explosion temperature, DTA/TGA, DSC, IR, NMR and particle size distribution, were conducted. For impact sensitivity and thermal sensitivity, relative rankings for the explosives were determined.

An Order Statistic Approach to Fuze Design.
William E. Baker, and Malcolm S. Taylor. Apr 81, 25p ARBRL-TR-02313, AD-E430 623

If X sub 1, X sub 2 ..., X sub n are independent, identically-distributed random variables, then Y sub 1 $<$ Y sub 2 $<$ ... $<$ Y sub n, where the Y sub 1's are the X sub 1's rearranged in order of increasing magnitudes, are defined to be the order statistics corresponding to the original random sample. Order statistics have been applied to the solution of a problem involving the determination of time windows for firing impulses in a fuzing system. A computer program has been written which provides the probability of a warhead fuzing as a function of the parameters which characterize the detonators. Conversely, given a required probability of fuzing, the program will determine the necessary detonator characteristics. Although motivated by this specific problem, the work is general in nature and should have additional applications in the armament research and development community.

Helicopter and Cable Drop Tests of a Multi-Sensor Yawsonde Instrumented SADARM Model.
Final rept.,
V. Oskay, and W. H. Mermagen. Mar 81, 127p
ARBRL-MR-03088, AD-E430 629
Supersedes Rept. no. ARBRL-IMRT-670.

A series of helicopter and cable drops of a yawsonde-instrumented SADARM model was designed to determine the flight behavior of the parachute/warhead system under conditions which would resemble both a real flight environment and a feasibility firing environment. About ninety percent of the helicopter and cable drops resulted in successful deployment of the vortex-ring parachute and proper operation of the system. Tests with the 2.13-metre parachute show that steady-state spin is achieved about four seconds after release for both cable and helicopter drops. The average spin rate observed with this parachute is 4.7 rps + or - 0.1 rps. The yawsonde results showed that this particular model/parachute combination has a bi-modal yaw behavior. The slow mode has a frequency equal to the pendular frequency of the system (about 1.0 Hz). This mode seems to be excited by external forces such as wind shear. The fast mode has a frequency about equal to the steady-state spin rate (about 4.8 Hz) and this mode appears to be excited by the dynamics of the parachute/payload system. The fast mode does not appear to be damped. From the yawsonde data, the amplitude of yaw seems to be about 5.0 degrees. Use of 1.83-metre parachute and smaller torque disk with this payload appears to increase the duration of the transitional time to about 7.5 seconds. Also, the average value of the steady-state spin is increased to 6.0 rps. The bimodal behavior of the system remains unchanged although with the smaller parachute the frequency of the fast mode is increased to about 6 Hz. The slow mode remains unchanged.

Soft Recovery Tests of a 155-mm Cannon Launched Guided Projectile Warhead, Type T.
Memorandum rept.,
James W. Evans, Carl R. Ruth, and Emerson V. Clarke, Jr. May 81, 43p Rept no. ARBRL-MR-03107

The launch and recovery portion of a launch survival test on a Type T, 155-mm Cannon Launched Guided Projectile (CLGP) warhead was conducted. This test employed the Large Caliber Soft Recovery System (LCSRS). The warhead body was adapted for this test by attaching a forward water scoop and a base structure. These components were necessary for launch from a 155-mm howitzer and recovery in the LCSRS. The projectile system was instrumented with a FM/FM telemetry system to measure base pressure, projectile acceleration, and strains on the inner wall of the warhead. Three instrumented, CLGP-warhead, test projectiles were fired from a 155-mm, M185 Howitzer tube using an M4A2, Zone 7, Propelling Charge. Telemetry data were received from all three and they were successfully recovered in the LCSRS. (Author)

STAR - Copperhead Interface.
Master's thesis,
Thomas Everett Cahill. Mar 81, 93p

This thesis provides the general design logic for a computer representation of the Field Artillery's precision guided munition- Copperhead. The design has been specifically structured to enable its integration into the Simulation of Tactical Alternative Responses (STAR) Model. (STAR is a stochastic force-on-force combat simulation.) Routines and events are developed which portray the target identification, target selection, firing, and impact phases of the Copperhead system. Interface points of the new logic with the current STAR model are identified and the modifications required to support the new system are discussed. Also presented is an overview of STAR's current Field Artillery module. Key Copperhead system characteristics which influence the model are also described. (Author)

Combustion Processes in Consolidated Propellants.
Memorandum rept.,
Ingo W. May, and Arpad A. Juhasz. May 81, 41p Rept no. ARBRL-MR-03108

The use of consolidated or compacted conventional gun propellants offers the ballistician the opportunity for significant performance increases through effective use of very high loading densities on the order of 1.2 g/cc. Such loading densities will only be effective, however, if accompanied by an increase in surface area progressivity. We report the results of an experimental program surveying the effects of ignition stimulus and compaction density on the combustion of simple wafers of consolidated charges of single and double base propellants. We have found that sample confinement, surface inhibition, and grain geometric factors, have significant effects on charge break-up and propellant mass burning rate. In effect, the samples can behave with strong surface area progressivity. With a knowledge of the base grain propellant linear burning rate, independently arrived at, we have extracted instantaneous surface area profiles for burning consolidated propellants. The progressive character of the gas generation rate from burning consolidated charge samples can be explained on the basis of 'macroscopic progressivity' defined as the controlled release of surface area through a continuous deconsolidation process.

Numerical Calculation of Shock-to-Detonation from Projectile Impact.
J. H. M. Fu, and G. E. Cort. Apr 81, 14p LA-8816-MS
Contract W-7405-ENG-36
Microfiche only after original copies are exhausted.

The results are described of some numerical calculations of the impact of steel cylinders and spheres on the plastic-bonded high explosive PBX 9501. The calculations were carried out by a reactive, multicomponent, two-dimensional, Eulerian hydrodynamic computer code, 2DE. The 2DE computer code is a finite-difference code that uses the donor-acceptor-cell method to compute mixed cell fluxes. The mechanism of shock initiation to detonation in heterogeneous explosives is best described as local decomposition at hot spots that are formed by shock interactions with density discontinuities. The liberated energy strengthens the shock so that as it interacts with additional inhomogeneities, hotter hot spots are formed, and more of the explosive is decomposed. The shock wave grows stronger until a detonation begins. This mechanism of initiation has been described numerically by the Forest Fire burn model, which gives the rate of explosive decomposition as a function of local pressure. The parameters in the Forest Fire burn model have been developed from experiments where the induced shock approximates a plane wave and are applied here to a situation where the induced shock is a divergent wave with curvature that depends on the size and shape of the projectile. The calculated results have been compared with results from experiments involving instrumented mock and live high explosives, with projectiles of varying sizes, shapes, and velocities. Good agreement between the calculated and experimental data was found. (ERA citation 06:024109)

Effect of Type of Explosives and Physical-Mechanical Properties of Explosive Rock on Formation of Toxic Gases in Atmosphere of Shafts.
E. O. Mindeli, and M. Y. Khudyakov. Feb 81, 8p
NASA-TM-76549
Contract NASW-3198
Transl. Into English from Vzryvnoye Delo (USSR), No. 72, 1973 p 147-150. Transl. By Scientific Translation Service, Santa Barbara, Calif.

The quality of toxic gases formed during explosive work in underground shafts depends upon the type of explosives and the conditions of explosion. Several types of explosives and rocks were examined. All remaining conditions were maintained the same (sandy-argillaceous stemming, electrical method of explosions, diameter of blast holes, and the direct triggering of charges).

Delay Cartridge with Temperature Programmed Flash Chamber.
Patent Application,
Michael L. Greene, and Frank J. Valenta. Filed 16 Mar 81, 12p AD-D008 553/0
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

An improved pyrotechnic delay system is given wherein temperature compensation means are utilized to minimize or eliminate ambient temperature affects upon the burning rate and variability of the delay. Apparatus and method are provided to increase the accuracy of cartridges employing pyrotechnic delay compositions by decreasing differences in composition burning time between extreme ambient temperatures. In the apparatus and method, a flash chamber is programmed to increase in volume during initiation of the delay column at elevated temperatures to increase the accuracy of cartridges employing pyrotechnic delay compositions. (Author)

Department of the Army, Washington, DC.
Catalysts for Nitramine Propellants.
Patent Application,
Robert A. Fifer, and James E. Cole. Filed 16 Mar 81, 9p AD-D008 540/7
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

Small amounts of metal tetrahydridoborohydrides, e.g. as low 1% by weight of the nitramine, are effective for increasing the burning rate of nitramine propellants. Excellent results can be obtained by employing the metal tetrahydridoborohydrides in an amount of about 10% by weight of the nitramine component, whereby burning rates several times higher than that obtained with the unmodified propellant are obtained. Amounts of such metal tetrahydridoborohydrides up to 20% or more by weight of the nitramine are also effective to increase the burning rate of nitramine propellants; however, the use of such larger amounts is less desirable since it reduces the proportion of nitramine and hence the enrgy output of the propellant.

Department of the Navy, Washington, DC.
Projectile Carrier for Liquid Propellant Gun.
Patent Application,
William L. Black, and Kenneth L. Moore. Filed 11 May 81, 13p AD-D008 546/4
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

This invention concerns an improved round for use in liquid propellant guns. The improved round comprises a projectile attached to a carrier which is shaped like an abbreviated cartridge case. The carrier has a plurality of injection ports that communicate to an expandable volume. Sealing means prevent the escape of liquid propellant from the expandable volume which upon injection causes the projectile to be pumped to a forcing cone leaving the carrier behind. Several ignition means are used employing Boxer, Berdan or electric primers. (Author)

A C Firing Ability of Detonation.
Final rept.,
V. Arasu, P. Satyavratan, and R. Vedam. 14 Dec 80, 21p IDL/R/D-80

This paper essentially analyses the series firing ability of detonators when subjected to AC mains voltage. The analysis and conclusions are made based on actual experiments conducted with the help of a custom built Electronic Firing system. At lower currents there exists a narrow band of critical starting angles at which misfires occur. This critical zone is explained based on a hypothesis of desensitization of the fusehead by the current flowing during the falling slope region. This phenomena is less severe at higher currents. A suitable device was developed to fire the detonators which eliminates misfires under AC mains voltage firing.

Plastic Bonded Explosives. II. PBX with Polyamide Binder (Plastbundna Spraengaemnen. II. PBX med Polyamid som Bindemedel),
Hugo Berg. Sep 80, 50p FOA-C-20371-D1
Text in Swedish, Abstract in English.

Existing methods for producing plastic bonded explosives with polyamides are examined. A literature survey is then presented on the solubility of various polyamides. Finally, a method is reported for producing molding powder for plastic bonded explosives using a mixture of RDX/polyamide at a 90/10 ratio. Two different polyamides are examined. The investigations show that polyamide can be used as a binding agent to agglomerate a fine crystalline explosive to form larger granules that can be used as molding powder for producing PBX with an explosive/polyamide ratio of 90/10. The slurry technique was used to produce the molding powder, although the process was varied somewhat depending on the polyamide used. The two polyamides examined as binders are Elvamide 8061 and Ultramid 1 C. In the former case methanol is used as the solvent and in the latter case methanol is mixed with water at a ratio of 80:20. The choice of coloring agent was shown to affect the properties of the finished molding powder and the yield. Since no suitable mold was available, the powder has not yet been molded into charges. A colorimetric method has been developed for the quantitative determination of RDX in the presence of Ultramid 1 C.

Modeling Studies of the Performance Characteristics of Composite Explosives.
C. Westmoreland, and E. L. Lee. May 81, 7p CONF-810602-26
Contract W-7405-ENG-48
Symposium on detonation, Annapolis, MD, USA, 19 Jun 1981.

A model for the initiation and detonation of composite explosives is proposed which considers both monopropellant and fuel-oxidizer reactions. This reactive model has been incorporated into an Eulerian hydrocode and used to simulate experimental results on composite explosives. The model accounts for variations in composition without the need to readjust rate parameters for each new mixture studied. A limited comparison shows that the calculated failure diameter as a function of composition is in reasonable agreement with experimental results. Calculations of idealized, representative systems indicate that a two-mode detonation behavior is unlikely, since the components interact strongly through the pressure dependent deflagration rate law. The calculations also show that either large transport coefficients or very small particle sizes are required to extract the energy of fuel-oxidizer mixtures in time to contribute effectively to explosive performance. (ERA citation 06:024112)

Contract W-7405-ENG-48
31. Aeroballistic Range Association conference, Pasadena, CA, USA, 7 Oct 1980.

It is demonstrated that effects of long rod penetrators on targets can be modeled by introducing a high pressure (energy) column on the penetration path in place of the projectile. This energy can be obtained from the kinetic energy of the penetrator; the equations of state of the materials used and a Bernoulli penetration condition. The model is supported by detailed hydro calculations. (ERA citation 06:022432)

Postdetonation Behavior of Condensed High Explosives by Modern Methods of Statistical Mechanics.
F. H. Ree. May 81, 11p CONF-810602-27
Contract W-7405-ENG-48
Symposium on detonation, Annapolis, MD, USA, 19 Jun 1981.

An a priori theory of statistical mechanics was recently used to compute the thermodynamic properties of N sub 2 , O sub 2 , CO sub 2 , and H sub 2 O. In this paper, the a priori theory, together with the one-fluid van der Waals mixture model is used to compute postdetonation properties of three different high explosives - liquid NO, RX-23-AB, and hexanitrobenzene (HNB). The results show satisfactory agreement with the experimental Chapman-Jouguet (C-J) data and the C-J expansion adiabat deduced from the cylinder test data. By comparing the results with experimental data and with results obtained from the Jacobs-Cowperthwaite-Zwisler 3 (JCZ3) equation of state and the Becker-Kistiakowsky-Wilson (BKW) equation of state, it is demonstrated that the a priori theory is superior to the two semi-empirical models. The adiabatic gamma, -(par. delta lnP/par. delta lnV)/ sub s/, predicted from the a priori theory decreases uniformly with the volume expansion. Analysis of the shock-wave data of liquid CO indicates that carbon atoms condense into a diamond-

like structure rather than a graphitelike structure, as is assumed by current postdetonation models. (ERA citation 06:024113)

A Mathematical Model of the Probability of Perforation of the Human Skull by a Ballistic Projectile.
Technical rept. Oct 78-Aug 80,
Larry M. Sturdivan, and Roy Bexon. Apr 81, 23p ARCSL-TR-81001, AD-E410 420

A mathematical model for the probability of penetration of the unprotected human skull is presented which relates the energy of the projectile to the properties of the skull. The model is specifically for steel spheres and cubes but can be used for other projectile shapes or densities provided that care is taken. Constants are obtained for the probabilistic model which allow calculation of the probability of penetration or, conversely, the velocity for a given probability of penetration for a given projectile/skull thickness combination.

Radio Frequency Oscillator Technique for Monitoring Velocity and Structural Integrity of Projectiles during Their Exit from the Muzzle.
Memorandum rept.,
Rurik K. Loder, and Jimmy Q. Schmidt. Apr 81, 36p ARBRL-MR-03100, AD-E430 632

Accurate knowledge of projectile velocity and integrity at muzzle exit is requisite to many aspects of research, development, product assurance, quality control, and field employment of projectile-gun systems. Standard methods for obtaining such information have severe limitations of applicability. As a result of a recent thrust program in the technology area of projectile-gun dynamics, a radio frequency oscillator technique has been developed and successfully tested for the 105mm M68 tank gun system. It provides real time measurement of projectile exit from the muzzle and, hence, projectile muzzle velocity. The electronic pulse associated with the measurement can also be used to trigger auxiliary instrumentation such as x-ray pulses and photographic cameras and to automatically adjust the corresponding delay times to the correct projectile muzzle velocity.

A Two-Dimensional Model of the Interior Ballistics of Bagged Artillery Charges.
Final rept. Jun 79-Jan 81,
Paul S. Gough. Apr 81, 208p PGA-TR-81-1, ARBRL-CR-00452, AD-E430 635
Contract DAAK11-79-C-0071

A theoretical model is described for digital simulation of flamespreading and pressure wave propagation in a single bag artillery charge. The theory is based on a numerical solution of the balance equations for unsteady, two-dimensional, axisymmetric, heterogeneous, reacting, two-phase flow. Flamespreading through bag charges is known to be influenced strongly by details of the ullage which initially surrounds the bag and by the behavior of the bag material itself. Accordingly, an explicit representation is made of the region occupied by the propelling charge at any time. The flow in the ullage, which surrounds the region occupied by the propellant, is represented as unsteady, inviscid and single-phase. The method of solution is illustrated by reference to the complete interior ballistic cycle of a top-tone 155-mm howitzer charge.

Shock Development Prior to Detonation in Shaped Layered Nonlinear Elastic Media with Stochastic Variability.
Final rept.,
Alan Jeffrey. 29 Aug 80, 3p AFOSR-TR-80-1083
Contract F49620-79-C-0150

The objective of this work was to examine the way in which an acceleration wave propagates in a randomly layered nonlinear medium in which the material constants vary stochastically from layer to layer. Furthermore the problem, although formulated as a one-dimensional configuration, was modified to describe propagation in a bar in which there is a slowly changing cross-sectional area. Thus the analysis may be applied to formed charges which have an axis of symmetry and a slowly varying cross-section normal to that axis.

Quantitative Assessment of Pressure Waves in Guns.
Technical rept.,
A. W. Horst, F. R. Lynn, and J. N. Walbert. May 81, 87p Rept no. ARBRL-TR-02319

Combustion instability in conventional guns is often manifested by the presence of longitudinal pressure waves traveling between the breech face and base of the projectile. Such waves are of concern because of their causal connection with high chamber pressures and pressurization rates which may in turn lead to breechblows, projectile or fuze malfunctions, and ballistic variability. While design approaches which minimize pressure waves are routinely employed today, the problem remains of specifying acceptable pressure-wave levels. This study addresses the establishment of the basis for an improved procedure for assessment of pressure waves. Several techniques are described for detecting the true pressure-wave signal from its carrier by removing what is essentially the classical Lagrangian pressure gradient from the experimental pressure-difference-versus-time profile, formed by subtracting the pressure-versus-time signal recorded at the forward end of the chamber from that recorded at the breech. The most successful approach is shown to be a digital Fourier-analysis technique involving multiple bandpass filtering of the recorded pressure-difference-versus-time profile. The resulting pressure-wave signal is characterized by an initial amplitude which is believed to be a physically well-motivated measure of the level of pressure waves and which offers procedural advantages in terms of both measurement and statistical processing of data. Integration of this technique into existing safety-assessment procedures is outlined.

T. J. Burgess, E. C. Cnare, W. L. Oberkampf, S. G. Beard, and M. Cowan. Dec 80, 58p SAND-80-1988
Contract AC04-76DP00789
Microfiche only after original copies are exhausted.

Unlike the better known rail gun, the theta gun applies the propelling force along the length of its projectile. This is shown to allow much greater acceleration of high fineness ratio projectiles for a given barrel pressure, allowing much shorter barrels for military applications. A computer code which simulates performance of the theta gun is described and experimental results from a few simple, low energy experiments show close agreement with code predictions. Trajectories and aerodynamic heating for three candidate military projectiles are calculated for vertical and horizontal atmospheric launches where initial velocity is as high as 3 km/s. The calculations indicate that in some cases a thin layer of heatshield (ablator) will be required to control projectile heating. (ERA citation 06:024010)

Fluidic Recoil Buffer for Small Arms.
Patent Application,
Michael Goes. Filed 12 Mar 81, 15p AD-D008 541/5
Availability: This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A weapon is provided with means to buffer the recoil which is produced when the weapon is fired. The buffer includes a fluidic device having a first and second chamber. During recoil, a compressive force is applied to the fluid in the first chamber, and flow from the first chamber to the second chamber is restricted by a fluidic diode in relationship to the pressure differential between the first and second chamber. On counter recoil, the fluid flows from the second chamber to the first chamber in an essentially unrestricted manner. The level of flow restriction by the fluidic diode is greater at high pressure differentials than at low pressure differentials. (Author)

Noise from Firing Ranges (Stoej fra Skydebaner).
Aug 79. 75p VEJLEDNING-2/1979, ISBN-87-503-3016-0
Text in Danish, abstract in English.

Noise from firing ranges constitutes a unique form of noise pollution, to which regulations govering typical industrial noise are difficult to apply. For this reason, and because of an increasing number of compliants from people residing near firing ranges, the Environmental Protection Office appointed a committee in January 1976 to examine problems involved in the establishment and operation of firing ranges. The present work describes the findings of this committee. Various types of ranges are described, the major categories being trapshooting ranges and fixed-target ranges. Each category has its own unique problems. Noise measurement units and devices are briefly described. Noise levels at various distances for various categories of guns from gallery pistols to machine guns are listed. Patterns for the spreading of noise under various wind conditions are described and methods of preventing the spread of noise including vegetation, dirt mounds, and screens are presented with respect to the various types of ranges. Environmental aspects of firing ranges other than noise pollution are also discussed. Lead shot, for example, may be ingested by birds and several cases are known in which swine have been poisoned by ingesting fragments from clay pigeons. Sample permits and complaints are presented in the appendices.

Very Low Frequency Transmission Loss in Shallow Water.
Final rept.,
Raymond H. Ferris. May 81, 55p Rept no. MAR-TR-263
Contract N00014-81-C-0164

In this study, acoustic transmission loss is calculated at frequencies below cut-off for a shallow water duct. A highly idealized model, based on realistic estimates of the gross acoustic properties of the sea-bed, is used to calculate the energy distribution in range, frequency, and depth as functions of the major environmental parameters. Results show that values of loss, at frequencies below cut-off, are similar to those at the frequency of minimum loss above cut-off. (Author)

Master's thesis,
Paul A. Dundas. Dec 80, 164p Rept no. AFIT/GE/EE/80D-17

A graphics system for display of sound spectrograms was designed and implemented on a Data General NOVA computer which is interconnected with a S-100 bus system. The system allows the user to interactively select a section of the spectrogram for further analysis through the use of a set of cursors. The computer systems used in the development of this project are described. The theory involved in the generation of digital sound spectrograms is detailed along with the display methodology used. The user is provided the choice of four spectral windows and the relative merits of each window are described and compared. The six major classifications of spectrogram patterns -- called sound-pattern groups -- are described. Spectrograms that show the characteristic pattern for each sound-pattern group are presented along with spectrograms that show the differences between narrow and wide-band spectral analysis. The computer programs developed on both the NOVA and the S-100 system are described. (Author)

Experimental Study of Noise Produced by an Underwater Acoustic Bubble Screen.
Master's thesis,
Clark Thomas Kelly. Jun 81, 65p

Measurements in the Naval Postgraduate School's anechoic water tanks were conducted to determine the acoustic noise in the frequency range twenty hertz to ten kilohertz associated with injecting air into the tank through perforations in a two inch diameter PVC pipe. The effective source level for a pipe having several rows of smaller holes is ten to fifteen decibels smaller over most of the band than for pipe having a single row of holes which produces the same flow rate. The measurements also indicate that the dominant source of noise is that associated with bubble formation and that the second most important source is from ascending bubbles. The impetus for this work was to study various aspects of the problem of designing a sound insulating bubble screen for the Carr Inlet Range of the Puget Sound Naval Shipyard. (Author)

The physical and electrical properties of GaAs show it to be an important semiconductor material for use in various electronic devices associated with advanced military systems. However, the realization of enhanced device performance has been delayed, partly due to the lack of consistent, high quality, semi-insulating GaAs substrate material. A modified liquid-encapsulated Czochralski technique employing pressure-assisted, in-situ compounding is described. This process, first demonstrated in the United States by the US Army Electronics Technology and Devices Laboratory, consistently yields high resistivity (to 10 to the 9th power ohm-cm) GaAs without the intentional addition of charge compensators. This approach is now becoming the basis for U.S. volume produc-

tion of large diameter, high quality, semi-insulating GaAs material. An automated system for the measurement of transport properties by use of the van der Pauw method is described. A mixed conduction analysis allows the direct determination of individual carrier concentrations and mobilities, intrinsic carrier concentration and Fermi level. Applied to ET&DL's non-Cr-doped GaAs, this analysis yields electron mobilities higher than Cr-doped material and Fermi levels which are nearly intrinsic. (Author)

Contract F19628-76-C-0156, ARPA Order-3096

The final report covers the design of ion selective filters and development of an ion exchange purification system for potassium bromide. The system consists of an ion selective filter for passage of potassium ions and a bromide anion exchange system for reduction of anionic impurities. Because of the high ionic strength of the solutions used and particularly their ability to hydrolyze amide and ester bonds, limitations are imposed on the materials that can be used for construction of those parts of the systems that contact these solutions. Certain addition polymers are more promising for construction of the components of such a system than others, these are discussed in the body of the report. A special group of components have been designed and assembled to provide the fittings, valves, electrode chambers, sampling valves, columns and filters necessary for a closed purification system. The preparation of the resins for use in such a system required that their conversion to the forms required for purification of KBr, require that the reactions for this conversion go almost to completion. The extent of conversion of the resins affect the operational characteristics of the system and are discussed in this report. The product of the initial purification is a strongly acid KBr solution and the techniques were developed to minimize external contamination during reduction of the purified salt solution to a solid. The final purification step made during the growth of the crystal is treatment with a reactive gas. A greaseless reactive gas manifold was constructed and several reactive gas treatments were used in an attempt to purify the KBr.

A large number of 5-10 micron thick n and p-type films on Si and CdTe substrates were prepared by Hg vapor rf triode-sputtering using pressed-powder targets. The targets had different percentages of CdTe particles and thus films with the CdTe mole percent (x values) between 0.18 and 0.27 were obtained. It was demonstrated that the grain size and mobility of the sputtered polycrystalline films, with a high degree of (111) crystal orientation, could be greatly increased by annealing the films at 553-623 degrees Kelvin in a Hg atmosphere. For example, x = 0.27 films had as-sputtered electron mobilities less than 20 percent of ideal bulk-crystal material at 300 degree Kelvin and less than 4 percent at 85 degree Kelvin with free electron concentrations 20 times intrinsic material at 85 degrees. After annealing at 553 degrees in 74 mm pressure of Hg, the electron mobilities were 71.5 and 16.5 percent of ideal values at 300 and 85 degrees respectively with carrier concentrations in the 10 to the sixteenth per cubic cm range. Similar results were obtained using CdTe and Si substrates and for other compositions. For films with 0.18 CdTe mole percent, electron mobilities of 24,000 cm squared per volt second were measured at 85 degrees. Two step annealing processes, with separate temperatures for grain size enlargement and stoichiometry adjustment, and low temperature heat treatments for preventing peeling by grading the Si-(Hg,Cd)Te interface appear necessary for further optimization of the annealing effects. Translation Operator for Finite Dmensional Electromagnetic Fields.
A. Q. Howard, Jr. Apr 81, 45p
Contract W-7405-ENG-48

Computation of electromagnetic fields in particular applications is usually accompanied by the adhoc assumption that the field contains a finite number of degrees of freedom. Herein, this assumption is made at the outset. It is shown that if an annular region between two closed surfaces contains no sources or sinks and is isotropic, lossless and homogeneous, a unique translation operator can be defined algebraically. Conservation of energy defines the translation operator T to within an arbitrary unitary transformation. The conditions of causality, unitarity and energy conservation are shown to uniquely determine T. Both scalar and vector fields are treated. In both of these cases, frequency and time domain transforms are computed. The transform T is compared with the analagous one as derived from the time domain Stratton-Chu Formulation. The application to a radiation condition boundary constraint on finite difference and finite element computations is discussed. (ERA citation 06:022866)

A priori estimates for solutions of the quasilinear hyperbolic-parabolic equations governing the initial value problem describing the motion of compressible, viscous and heat-conductive, Newtonian fluids are derived by means of a new energy method. This technique enables us to simplify and unify our previous results on the global existence in time and uniqueness of smooth solutions of these equations for sufficiently smooth and 'small' initial data and to obtain their rate of decay. Trapping of Water Waves Above a Round Sill.
Technical summary rept.,
Yuriko Yamamuro. Mar 81, 35p Rept no. MRC-TSR-2195
Contract DAAG29-80-C-0041, Grant NSF-MCS79-27062

The three-dimensional problem of wave-trapping above a submerged round sill was first analyzed by Longuet-Higgins (1967) on the basis of a linear shallow-water theory. The large responses predicted by the theory were, however, not well borne out by the experiments of Barnard, Pritchard and Provis (1981) and this has motivated a more detailed study of the problem. A full, linear theory for both inviscid and weakly viscous fluid, without any shallow-water assumptions, is presented here. It reveals important limitations on the use of shallow-water theory and the reasons for them. In particular, while the qualitative features of wave-trapping are similar to those of shallow-water theory, the nearly-resonant frequencies differ significantly, and since the resonances are narrow, the observed amplitudes at a given frequency differ greatly. The geometry is strongly indicative of long waves and the dispersion relation appears quite consistent with that, but the part of the motion at wave numbers that are not small has, despite the small amplitude, a substantial effect on the response to excitation. Prepared in cooperation with Lehigh Uviv., Bethlehem, PA. Dept. of Mechanical Engineering and Mechanics.

A discussion of the role of visual and probe measurements in turbulent structure research is given, stressing the constraining limitations of each and the interrelationships of the two methods. A selective history of the use of visual results is discussed in terms of the constraining limitations of the visual methods. Retrospective remarks are presented concerning the Stanford visual data on the inner portions of turbulent boundary layer structure. The final section discusses some general features of what is currently known about the structure of turbulent boundary layers, draws conclusions from this general knowledge, and poses questions that seem currently important in gaining further understanding. The paper stresses overall aspects of the structure problem at the expense of details in an attempt to gain perspective. (Author)

Navier-Stokes Solutions for a Supersonic Coflowing Axisymetric Nozzle with a Thick Base Annulus.
Doctoral thesis,
Gerald Alan Hasen. Apr 81, 161p Rept no. AFIT/DS/AA/81-2

Numerical solutions of the Navier-Stokes equations are obtained for a supersonic coflowing axisymmetric nozzle (Infinity) = 2,200,000. Five jet pressure ratio conditions ranging from a highly overexpanded case which exhibits a Mach disc shock formation to a slightly underexpanded case are examined and solved numerically. MacCormack's explicit method is applied as the numerical algorithm. An adaptive grid is utilized in the nozzle wake to allow the fine mesh region of the computational grid to remain in areas containing relatively high flow gradients. Locally dependent eddy viscosity modelling is applied in the form of a Cebeci-Smith two layer model in the boundary layer region on the nozzle walls, and a form of the Prandtl mixing length model in the nozzle wake. A two-dimensional wedge-flat plate validation case was computed using these models with good results. The computational results for the coflowing nozzle accurately reproduced the experimentally observed viscous effects on the nozzle base pressure and shock locations that are caused by the thick nozzle base annulus. Correct transition was achieved numerically from regularly reflected shock waves at the line of symmetry in the jet core to the Mach disc reflection at the appropriate nozzle pressure ratio. Presented at the 2ND Symp. On Turbulent Shear Flows, London, 2-4 Jul. 1979.

Results of hot wire measurements in an incompressible jet issuing from an array of rectangular lobes, equally spaced with their small dimensions in a line, both as a free jet, and as a confined jet, are presented. In the case of a multiple free jet, the flow field for downstream distance x greater than 60D (D = width of a lobe) resembles that of a jet exiting from a two-dimensional nozzle with its short dimension being the long dimension of the lobe. The field of turbulence is found to be nearly isotropic in the plane containing the small dimension of the lobes for x greater than 60D. In the case of a confined multiple jet, the flow field is observed to be nearly homogeneous and isotropic for x greater than 60D.

L. P. Purtell, P. S. Klebanoff, and F. T. Buckley.
May 81, 10p
Pub. in Phys. Fluids 24, n5 p802-811 May 81.

The results of an experimental investigation of a turbulent boundary layer with zero-pressure gradient directed toward extending the data base at low Reynolds numbers are presented. The data obtained are concerned primarily with mean-velocity distributions, skin-friction coefficients, and distributions of intensity of the longitudinal-component of the turbulent-velocity fluctuations for Reynolds numbers based on momentum thickness as low as 465. The validity, at low Reynolds numbers, of the semiempirical laws characterizing the inner and outer regions of the boundary layer is examined.

Simulating Interactions Between Turbulence and Particles in Erosive Flow and Transport.
A. C. Buckingham, and W. J. Siekhaus. 1981, 13p CONF-810702-2
Contract W-7405-ENG-48
International conference on numerical methods for laminar and turbulent flow, Venice, Italy, 13 Jul 1981.

A numerical procedure is described for simulating fluctuating gas motions and resulting forces on gas-borne particulates. Included are some of the particle influences which significantly alter the driving turbulent field. The coupling apparent between dispersed phase particles and continuous phase turbulent flow is introduced with the help of observations from complementary two-phase combustion wind tunnel experiments. In the simulations, particle-to-gas relative velocities and resulting forces on the particles are obtained at incremental time steps for statistically representative particle groups using a random selection method. The fluctuating velocity components are constrained so that their ensemble averages correspond to the pre-determined local mean turbulent energy. The influence of gas-borne particles on turbulent transport, combustion kinetics and subsequent wall surface erosion/corrosion is the central issue of this research. (ERA citation 06:022443)

Contract N00014-78-C-0131
See also report dated 17 Apr 80, AD-A090 840.

A short resonator (30 cm) CuBr laser was built and its performance measured as a function of various operating conditions. Aside from packaging and prime power considerations which were not addressed in this study, the CuBr laser has exceeded all minimum specifications for the Navy bathymetry application. One set of simultaneously obtained operating conditions are as follows: 140 micro-Joules per pulse, 4.5 ns laser pulse width, 16 kHz repetition rate, 0.15% efficiency, 525 C operating temperature. Our analysis indicates that in order to develop a Cu vapor laser for bathymetry application having an ultra-short laser pulse width (<5 nsec) the laser cavity has to be made shorter than or equal to 30 cm and the excitation rate has to be very high. Further issues relating to other bathymetry laser requirements such as energy per pulse, efficiency, repetition rate, lifetime, compactness, ruggedness and portability have been easily achieved by our existing laser tube.

Improved Injection Laser Waveguide Coupler.
Final rept.,
Philip Bear. May 81, 23p
Contract N00173-79-C-0470

The present program goal was to enhance the waveguide coupler design to provide a device which can be aligned with a standard micromanipulator and achieve 50% or better coupling efficiency. The design approach was to develop static mechanical spacers for the waveguide coupler which furnish easy and precise transverse and longitudinal positioning of a LiNbO3 waveguide with respect to an injection laser diode. The program was to include the following tasks: (1) modify the waveguide coupler design and assembly procedures to provide a device that can be readily assembled and will achieve near theoretical coupling efficiency; (2) fabricate these optimized couplers using Hitachi laser diodes and evaluate these devices; (3) deliver two couplers without Ti:LiNbO3 waveguides attached; and (4) provide a cost estimate for the fabrication of ten such units. The variation in tolerances of the components and the capability of present state-of-the-art micropositioning devices to obtain and hold mechanical position accuracies required for the laser diode to waveguide coupler are not adequate to obtain reliable devices that meet the program goal of 50% coupling efficiency. The positional stability of bonding materials for the laser diode and waveguide were also determined to be inadequate to maintain the precise tolerance required. It is recommended that consideration be given to an R and D program to investigate the viability of a monolithic integrated optic approach for the laser diode to waveguide coupler using a common substrate.

Phase Transition Cooled Window Studies for High Average Power Electron Guns.
Final rept.,
G. Loda, and D. Forcier. Dec 80, 88p Rept no. RPC-80-11403-80-FR
Contract DAAK40-79-C-0258, ARPA Order-3498

The window used to transmit electron beams for use in high average power UV/visible lasers has been a critical technology issue. The window structure must satisfy a number of conflicting requirements including: vacuum integrity, strength to overcome both the static and dynamic pressure loads of the laser gas and a low mass density to minimize energy loss by the electron beam. In addition, it must not perturb the laser gas flow and must be able to dissipate the power deposited by the electron beam. Two experiments were undertaken to demonstrate the applicability of phase transition cooling for high power laser systems. In the first of these a full width 50 cm module was tested with a constant input heat source. The second experiment used a pulsed e-beam source to demonstrate cooling for a low duty cycle high peak power pulsed system. The applicability of phase transition cooling for a dual foil geometry was clearly demonstrated. Cooling rates in excess of 100 W/(sq cm)/foil surface with mass flow rates consistent with low areal mass density were achieved. This represents a factor of ten improvement over prexisting state of the art. (Author)

Contract N00014-80-C-0442, DARPA Order-3125

The objective of this program is to demonstrate the scaling potential of efficient Raman frequency conversion techniques for ultraviolet lasers. Molecular hydrogen is used as the Raman medium and an oscillator-amplifier configuration is employed to maximize conversion efficiency and beam quality. At the present time, major program milestones have been successfully met. Injection locking has been demonstrated to be an efficient technique for laser bandwidth control. Good optical beam quality has been achieved on the XeF laser through the use of unstable resonator optics. Conversion of XeF laser radiation to blue-green wavelengths has been demonstrated in the Raman oscillator. Work is now in progress on assembly of the Raman oscillator-amplifier system to complete the final phase of the program. It is expected that 50% energy efficiency will be demonstrated for the shift of 353 nm XeF radiation to 498 nm. (Author)

Includes Rept. no. NRL-MR-3983 dated 18 Apr 79, AD-A069 461.

The non-linear theory was developed for the efficiency enhancement of the electron cyclotron maser, by tapering the external magnetic field. The experimental design aspects have been considered for the effects of tapered magnetic fields on the gyrotron efficiency. An alternate configuration has been theoretically investigated, for the utilization of a cherenkov-type interaction for the generation of radiation by an electron beam in a dielectrically loaded waveguide.

Contract F49620-79-C-0195

An instability in the output of a high-power unstable-resonator cw CO2 laser is analyzed in terms of the perturbative effect of an acoustic wave which is induced by laser heating. The alignment sensitivity of such a laser is also explained in terms of a temperature gradient along the gas-flow direction, which is transverse to the laser axis. We extend our instability analysis to a simple one-dimensional model of a supersonic laser, which we determine to be stable. Finally, we present a new computational technique to determine the intensity distribution and output coupling of the modes of an unstable resonator whose gain is saturated by a variable amount by the flux of the lowest-loss mode. The intensity distribution of this lowest-loss mode is determined self consistently. (Author)

Metal Vapor Laser Contaminant Study.
Final rept.,
T. W. Karras, and B. G. Bricks. May 80, 103p
AFOSR-TR-81-0520
Contract F49620-79-C-0177

Contaminants evolved during lead and copper vapor laser operation are identified. The principal long term source is the hot high density alumina discharge tube. Procedures for decontamination down to 10 to the -6 mm partial pressure are described. Such decontamination is shown to be necessary for proper wick function and sealed-off operation. In conjunction with this work, a model has been demonstrated that relates metal vapor containment time to wick dimensions and a new sealed-off laser design has been successfully tested. (Author)

See also Rept. Nos. RH-77-1, AD-A037 680 and DRSMI-H-78-1-VOL-6, AD-A082 665.

The present volume serves to update most of the areas covered in the previous documents. Such areas include all nuclear processes, and atomic collisions occurring at high energies, i.e., above about 100 eV impact energy. However, even in those areas where new data are not presented

here, references are given to past volumes in order to facilitate access to the previous data. Another function of the present volume is to expand somewhat the scope of our data coverage, both with respect to atomic nd molecular structural properties and with respect to atomic collisions (by the latter term, we mean two- and three- body collisions between electrons, ions, atoms, molecules, and photons at impact energies sufficiently low that nuclear forces are unimportant). New species and sets of collision partners that have recently assumed importance are treated here, and other systems that may become important in the gas laser context are given attention. A significant amount of new material is also added to the chapter on surface impact phenomena, partly because of current interest in hollow-cathode lasers.

Recent Los Alamos investigations suggest that a liquefied noble element may be the long-sought medium for a nuclear-excited laser or flashlamp. This report suggests research needed to confirm this finding and to provide a basis for design and application studies. Quantitative and qualitative information are needed on the nature and behavior of the excited species, the effects of impurities and additives in the liquid phase under nuclear excitation, and the existence and magnitudes of nonlinear effects. Questions that need to be addressed and the most appropriate types of facilities for this task are identified. (ERA citation 06:024015)

Out-of-Focus Intensity Distribution: Effects of Focal Number and Aberration.
G. A. Kyrala. 1981, 7p CONF-810429-25
Contract W-7405-ENG-36
Conference on optics, Santa Fe, NM, USA, 6 Apr 1981.

Shock wave experiments contemplated on powerful CO sub 2 lasers require uniform planar illuminations over spot sizes much larger than the diffraction limit focal spot size of the focusing optics. Cost as well as space considerations limit one's choice of optics to parabolic mirrors with focal lengths between 78 and 150 cm, and apertures to 35 cm. Within these constraints one either modifies the incident laser energy distribution to modify the focal spot shape, or works out of the focal plane. The latter option is analyzed using a fast Fourier method to calculate the intensity distributions for two focal lengths (78 and 132 cm) and various measured optical distortions (Phase only) for the focusing optics. I found that a 78 cm element produced more uniform spots of diameter 500 mu m. The 132 cm element was less sensitive to focusing/positioning error than the 78 cm element. (ERA citation 06:024016)

Laser Damage Testing of Coated Reflectors at Excimer Laser Wavelengths.
S. R. Foltyn, and B. E. Newnam. 1981, 11p CONF-810429-33
Contract W-7405-ENG-36
Conference on optics, Santa Fe, NM, USA, 6 Apr 1981.

An important parameter in the design of large-scale ultraviolet lasers (such as those envisioned for Inertial Confinement Fusion and Molecular Laser Isotope Separation) is the resistance to optical damage of windows, AR-coatings, and coated reflectors. In addressing the problem of evaluating and optimizing highly reflective dielectric stacks, we have measured the damage thresholds of a variety of 248-nm, 308-nm, and 351-nm reflectors. The coatings were composed of quarterwave stacks of oxide and/or fluoride films deposited on Suprasil 2 substrates. Testing was accomplished at 35 Hz with nominal 10-ns pulses focused to a mean 1/e exp 2 diameter of 0.5 to 0.6 mm. Damage threshold (defined as the highest fluence at which 10/10 sites survived 1000 shots) ranged from 1 to 5 J/cm exp 2 , with a strong dependence upon laser wavelength and reflector coating materials. Laser Angle Sensor Development.
Final Report, 1979 - 1980.
C. R. Pond, and P. D. Texeira. Oct 80, 73p
NASA-CR-159385, NASA-159306
Contract NAS1-15987

Electrical and optical parameters were developed for a two-axis (pitch/roll) laser angle sensor. The laser angle sensor was a fringe counting interferometer, where interference fringes were generated by a small passive reflecting element on the model. The laser source and detector were mounted in the plenum above the model. Two axis optical distortion measurements of flow characteristics in 0.3 miransonic cryogenic tunnel were made with a shearing interferometer. The measurement results provided basis for estimating the optical parameters of the laser angle sensor. Experimental and analytical information was generated on model windows to cover the reflector. A two-axis breadboard was assembled to evaluate different measurement concepts. The measurement results were used to develop a preliminary design of a laser angle sensor.

National Physical Laboratory-National Bureau of Standards Iodine-Stabilized Helium-Neon Laser Intercomparison.
Final rept.,
H. P. Layer, W. R. C. Rowley, and B. R. Marx. Apr 81, 3p
Pub. in Optical Letters 6, n4 p188-190 Apr 81.

The frequencies of two helium-neon lasers stabilized by intracavity saturated absorption of iodine (127I2) built at the National Bureau of Standards (NBS) and the National Physical Laboratory have been compared by beat-frequency measurement. The NBS laser exhibited a power-dependent frequency shift that was reproducible and significant in size (2x10 to the -10th power) over the working range of the power output. The orgin of the power shift has not been established, but several possible sources of the shift have been eliminated by our investigations. Specifically, the effect is not electronic in origin. No similar shift was observed in two lasers built at the National Physical Laboratory.

Determination of Integrated Optical Thickness of Clouds from Lunar Irradiance Measurements.
Final rept. 15 Jun-15 Oct 79,
M. G. Ceruti. 15 Oct 79, 45p Rept no. NOSC/TR-470
See also AD-771 827.

A procedure is suggested to obtain the effective optical thickness, tau of clouds by measuring the atmospheric transmission of moonlight both with and without cloud cover. The optical thickness is calculated from the transmission using a theory of R E Danielson, D R Moore and H C van de Hulst (The Transfer of Visible Radiation Through Clouds, J. Atmosph. Sci., 26, 1078 (1969)), later modified by E A Bucher, (Computer Simulation of Light Pulse Propagation for Communications Through Thick Clouds, Applied Optics, 12, No. 10, p 2391-2400 (1973)). By using a wide field of view receiver to measure the irradiance, one obtains a spatial averaged value of tau, rather than a point measurement. Therefore, this method of cloud optical thickness determination may be more reliable than some previously used methods. (Author)

A High Performance Fiber Optic Pressure Penetrator for Use in the Deep Ocean.
Progress rept. Jan 80-Jan 81,
S. J. Cowen. 26 Feb 81, 35p Rept no. NOSC/TR-644

This report describes results obtained in an FY 80 developmental program carried out at the Naval Ocean System Center, San Diego, under Independent Exploratory Development funding. The objective was to develop a robust, fully-demountable, high pressure penetrator design suitable for coupling light signals transmitted by optical fiber elements in an undersea cable operated at high ambient hydrostatic pressure into an electronics package or manned space. The feasibility of constructing such penetrators utilizing Graded Refractive Index (GRIN) rod lenses as combination pressure barriers and imaging devices has been demonstrated. Prototype realizations have exhibited excellent optical throughput performance and readily survive in excess of 10 000 psi pressure differential as well as tolerating a wide temperature range. The design lends itself to hermetic construction for applications requiring no vapor diffusion over long mission durations. Such devices exhibit excellent potential for satisfying SUBSAFE requirements for manned submarine applications. (Author)

Phase Estimation Techniques for Active Optics Systems Used in Real-Time Wavefront Reconstruction.
Master's thesis,
Fernando Pinzon Rojas. Dec 80, 140p Rept no. AFIT/GEO/EE/80D-4

Two analyses ae presented, which involve estimation of constant phase from single detector and detector array measurements. The single detector analysis is carried out in a discrete mode to obtain algorithms based on photon counting. The method used follows the Maximum A Posteriori and Maximum Likelihood estimation theories. Both white Gaussian noise and Poisson Shot noise limited conditions are considered. Simulation results show that signal-to-noise ratios of 17 dB or better are needed to produce adequate estimates. Estimate improvement is obtained as more photon counts are performed. In this sense, photon counting seems to be inferior to current measuring, but the error variance is only 1.65 dB larger in the worst case, where three photon counts are performed. An extension of the single detector analysis is made, using only the Gaussian noise assumption, to derive an algorithm that jointly estimates the phase distribution over an optical wavefront. The procedure is based on a parametric dependence between the measurements performed by adjacent detectors, and on the a priori knowledge available through a covariance matrix. An algorithm for processing continuous waveform measurements is developed, but no computer simulation is included due to difficulties encountered in solving the feedback system equations.

Turbulence Effects on Open Air Multipaths.
Final rept.,
Wendell R. Watkins, Kenneth O. White, and Laura J. Crow. May 81, 34p Rept no. ERADCOM/ASL-TR-0086

The possible effects of turbulence on the maximum usable pathlength of an open air multipath were investigated. Open air multipahts can be used in conjunction with scanning optical sources to measure trace gases along open air optical paths for field testing of military electro-optical systems including high energy lasers. Turbulence was found to be the major source of system degradation for an open air optical multipath. The effects of turbulence on beam spreading as a function of position along the multipath were measured. Multipath optics image and diffuse the input beam in a beam conserving fashion in producing the multipath. Turbulence has its strongest degrading effects on the diffused beams in the multipaths, thus open air multipaths would require turbulence shielding of this portion of the optical path to be effectively used, especially during high daytime turbulence levels. Such systems can, however, be easily used in enclosed building environments without any path shielding.

Long Pulse XeCl Laser Frequency Down Conversion and Low Voltage, Low Energy X-Ray Preionization Source.
Final rept. Oct 79-Mar 81,
J. I. Levatter, and S. C. Lin. May 81, 26p
Contract N00014-79-C-0955

The first program, Long Pulse XeCl Laser Frequency Down Conversion, was initiated following the encouraging Raman shifting results. The second program, Low Voltage, Low Energy X-Ray Preionization Source was undertaken after it was realized that the energy and power scaling of certain avalanche discharge excited lasers required a reliable, non-contaminating volumetric source of electron preionization as could be provided by moderate energy x-rays. In this initial experiment, the 308 nm UV output from the UCSD Xe Cl laser was focused into a lead vapor (Pb) heat pipe and the stimulated Raman emission in the blue-green was monitored. Research involved the refinement of the Raman down conversion experiment which consisted primarily of the improvement of the XeCl laser mode quality. This work and the results thereof are discussed in Section II. SEction III describes the results of an engineering program to build a reliable low energy X-ray source suitable for the preionization of rare-gas/halide and mercury-halide discharge excited lasers.

Contract W-7405-ENG-36
Conference on optics, Santa Fe, NM, USA, 6 Apr 1981.

A new technique is discussed for signal strength enhancement of high-frequency (>1 GHz), spectrally-broad, analog signals through 1 km of optical fiber. The conventional method for optical measurement of high-frequency gamma ray signals is to use an optical fiber placed in the gamma radiation beam as a Cerenkov transducer. The radiation-induced optical signal is degraded by material dispersion in transmission through the fiber. To reconstruct the signal (which is carried by each wavelength) and preserve the high-frequency components, a narrow-band filter selects an appropriate bandwidth (1 nm). The filtered signal is detected using a high-speed, microchannel-plate (MCP) photomultiplier detector and recorded on high-speed oscilloscopes. (ERA citation 06:022420)

Contract W-7405-ENG-36
Conference on optics, Santa Fe, NM, USA, 6 Apr 1981.

We report the first demonstration of uv phase conjugation. Using a 15 psec, 2660 A pulse, 0.1% conjugate reflectivities were obtained via degenerate four-wave mixing in 1-mm samples of CS sub 2 mixtures. While pure CS sub 2 did not exhibit the effect, dilution in several uv transmitting solvents opened up a concentration-tunable (2450 A to 2850 A) spectral window, allowing the optical Kerr effect to be utilized. Weaker phase conjugation at 2660 A was also observed in other Kerr media and in saturable absorber media. (ERA citation 06:022435)

Analytic Solutions for Three- and Four-Wave Mixing Via Generalized Bose Operators.
Final rept.,
J. Katriel, and D. G. Hummer. 1981, 14p
Pub. in Jnl. of Physics, A, Mathematical and General 14, p1211-1224 1981.

New types of generalized Bose operators are constructed. They are applied to the linearization of the equations of motion describing three- and four-wave mixing, resulting in integral equations for the temporal behaviour of the various fields. Some mathematical properties of these integral equations are studied, thus establishing the equivalence between approahes differing in the manner in which the linearization is carried out. The integral equations are solved analytically in terms of Jacobian elliptic functions.

The Space-Charge Resonance Accelerator.
Final rept.,
Han S. Uhm, and Joon Y. Choe. 1 Apr 81, 18p
Rept no. NSWC/TR-81-137

The space-charge resonance accelerator (SRA) consists of a relativistic electron beam propagation through a dielectric loaded drift tube. In a range of physical parameters, the phase velocity of a self-growing space-charge wave increases slowly from zero to a large beam velocity as it propagates into the downstream region, thereby trapping and accelerating ions by its electric field. The self-growing mechanism of the space-charge wave is a typical Cherenkov radiation. (Author)

Investigation of Periodic Acceleration Tube Discharges with a Capacitive Pickup Array.
T. A. Trainor. 1981, 3p CONF-810468-4
Contract AC06-76ER01388
International conference on electrostatic accelerator technology, Oak Ridge, TN, USA, 13 Apr 1981.

Several diagnostic techniques are described, which were used to determine the cause of periodic tube discharges and consequent fast terminal voltage drops in an FN tandom accelerator which were observed to occur at high beam intensities for the voltage range 7 to 9 MV. Terminal voltage drops were first monitored with a generating voltmeter (GVM). As a result of this study it was decided to install an array of four capacitive pickups (mushrooms) along the length of the pressure vessel. Information obtained from these pickups and analysis of beam fluctuation data permitted the source of the difficulty to be identified as a high transmission grid installed at the entrance to acceleration tube 1. Design Study for a High-Current, Steady-State Auto-Resonant Accelerator. Addendum to Final Report, July 14, 1979-November 14, 1979.
W. E. Drummond. 1979, 60p COO-5911-5
Contract AC05-78ER05911

A number of potential applications for the auto-resonant accelerator (ARA) are discussed. The potential uses are divided into two categories: the use of the ARA in energy or fuel production cycles which would gave significant energy policy ramifications, and miscellaneous research, medical and industrial use of the ARA which may be attractive. The output parameters, cost and size data are summarized to provide a basis for judging potential uses. The use of ARA for the production of fissile material is discussed, as is its use as a plasma heating device for tokamak experiments or potential fusion reactors. (ERA citation 06:022484)

Use of a Small off-Line Computer in the Operation of a Versatile Heavy Ion Cyclotron.
R. A. Gough. Mar 81, 6p CONF-810314-158
Contract W-7405-ENG-48
Particle accelerator conference, Washington, DC, USA, 11 Mar 1981.

In a modern heavy ion cyclotron with variable energy and particle species, it is essential to provide the operations staff with fast and easy access to parameter information. At the Berkeley 88-Ion Cyclotron, which operates under manual control, an interactive computer program has been developed to meet this requirement. The program is written in BASIC on a small off-line computer to perform a variety of calculations for any ion species and energy. The program can provide the operator with cyclotron and beam line settings for any beam, regardless of whether or not the beam has been previously run, by utilizing the broad data base acquired over a decade of heavy ion operation. A number of additional calculations now being performed conveniently and routinely by the operations staff will be discussed. The use of this program has greatly streamlined the operation of the cyclotron because needed information can be obtained quickly and reliably. (ERA citation 06:022487)

Simplified RF Power System for Wideroe-Type Linacs.
J. Fugitt, D. Howard, F. Crosby, R. Johnson, and M. Nolan. Mar 81, 6p CONF-810314-159
Contract W-7405-ENG-48
Particle accelerator conference, Washington, DC, USA, 11 Mar 1981.

The RF system for the SuperHILAC injector linac was designed and constructed for minimum system complexity, wide dynamic range, and ease of maintenance. The final amplifier is close coupled to the linac and operates in an efficient semi-linear mode, eliminating troublesome transmission lines, modulators, and high level regulators. The system has been operated at over 250 kW, 23 MHz with good regulation. The low level RF electronics are contained in a single chassis adjacent to the RF control computer, which monitors all important operating parameters. A unique 360 exp 0 phase and amplitude modular is used for precise control and regulation of the accelerating voltage. (ERA citation 06:022488)

Contract W-7405-ENG-48
Particle accelerator conference, Washington, DC, USA, 11 Mar 1981.

An ever-present need in an accelerator-based research program is knowing the energy of the beam delivered to the experimenter. Knowledge of accelerator parameters is generally good enough to predict the beam energy to within a few percent as it leaves the machine, but after passage through a complex switchyard, with air gaps, and non-destructive monitors, substantial changes in the energy can occur. Knowledge of the material in the beam path allows for calculations of expected energy loss, but this knowledge is not always complete, and the unforeseen often plays tricks on the unwary experimenter; for example, a section of beam-pipe inadvertently let up to air, or a monitor left in the beam-line from the previous run. Although such occurrences are rare, to say they do not happen would be grossly inaccurate. The only defense of the experimenter, then, is to have an accurate technique for determining the beam energy at his target location, a technique which re-

quires little beam time and which is non-disruptive of his experimental setup. The device described meets all of these criteria, and is now used extensively in the Nuclear Science and Biomedical programs at the Bevalac. (ERA citation 06:022469)

Wigglers: The Newest Profession.
J. E. Spencer. 1981, 7p CONF-810340-11, PEP-NOTE-341
Contract AC03-76SF00515
International conference on magnet technology, Karlsrube, F.R. Germany, 30 Mar 1981.

Wiggler systems have been used in storage rings within the last year to increase the intensity of synchrotron radiation available for experiments as well as to increase the reaction rates in high energy physics experiments. Multiperiod wigglers or undulators have also been used recently to make quasi-monochromatic photon beams as well as amplify existing photon beams such as in the free electron laser. If one defines a wiggler to be any system of transverse, periodic electromagnetic fields, then recent results on photon production via charged particle channeling in crystals also fall within this sphere. Of course, any periodic modulation of a charge or magnetic moment (e.g., by a laser) could produce coherent radiation or, conversely, passage through a periodic aperture (e.g., a metal bellows). This discussion is limited to a typical, active, macroscopic device and how it provides some unique advantages which are practical to achieve in storage rings. As implied, the subject divides into two basic parts - one related to the radiation from the wiggler and the other related to machine physics applications, e.g., tailoring the phase space of the particle beam, modifying its damping rates or possibly optimizing a ring for production of radiation. Neither area is exhausted nor hopefully the reader, since our goal is only to present enough information to allow one to make reasonable estimates of some important effects. (ERA citation 06:022495)

Overview of the ETA/ATA Pulse Power.
L. L. Reginato, and R. E. Hester. 30 May 80, 4p CONF-800640-21
Contract W-7405-ENG-48
14. pulse power modulator symposium, Orlando, FL, USA, 3 Jun 1980.

A pulsed electron accelerator has been constructed and is now in operation at the Lawrence Livermore Laboratory. This Experimental Test Accelerator (ETA) a 5 MeV, 10 kA, 50 ns FWHM, five pulse burst at 1 kHz, was designed to be the front end or injector for the Advanced Test Accelerator (ATA). The ATA is presently under construction and will have the following parameters: beam energy - 50 MeV, beam current - 10 kA, pulse length - 70 ns, repetition rate in a ten pulse burst - 1 kHz. The parameters which make the pulse power components unique for these machines are the high repetition rate in a burst and a high degree of regulation in the system to insure pulse to pulse repeatability. Because of the larger number of components requird for ATA, a much higher degree of reliability will be required. Improvements and modifications continue to be made on the ETA, which is serving as a base of development for all ATA pulse power components. Furthermore, all ATA pulse power components will be tested at length in a test stand before beginning mass production to insure proper design to meet voltage, current, rep-rate and life requirements. Contract W-7405-ENG-36
Adriatic europhysics study on nuclear physics dynamics of heavy-ion collisions conference, Croatis, Yugoslavia, 25 May 1981.

The current knowledge and theoretical speculations concerning the nuclear equation of state is discussed. Conventional relativistic nuclear fluid dynamics, which is based on the assumption that the nucleon mean free path is zero and consequently neglects the interpenetration of the target and projectile upon contact, is also discussed. Results of such calculations performed for three different equations of state are compared with experimental data for both all impact parameters and central collisions for the reaction exp 20 Ne + exp 238 U at a laboratory bombarding energy per nucleon of 393 MeV. These comparisons suggest that we need to take into account target and projectile interpenetration, which is done on the basis of a two-fluid model. An assessment of the present status and future prospects for determining the nuclear equation of state with high-energy heavy ions is given. (ERA citation 06:022854)

Discharge Processes in the Oxygen Plasma.
Final rept. Oct 75-Oct 80,
John W. Dettmer. Apr 81, 312p Rept no. AFWAL-TR-80-2120

The electric glow discharge in oxygen was experimentally studied and mathematically modeled for the parameter space of one to ten torr of pressure and for current densities up to 35 milliamperes per square centimeter. Experimentally it was observed that the oxygen discharge existed in one of two forms: a high-electric-field form or a low electric-field form. The high field form was present at high

currents and low pressures, the low field form at low currents and high pressures. The high field form exhibited stable characteristics while the low field form was observed to be nonstable, exhibiting periodic or aperiodic oscillatory behavior. The periodic oscillations existed only at certain frequencies or modes, and the discharge impedance was a function of the frequency. The optical output of the oscillatory form of the discharge was highly modulated with short duty cycle pulses. The oscillations exhibited a small amount of normal disposition. The point of transition between forms and the electrical impedance of the forms was unaffected by the addition of an inert gas, argon, to the discharge. Adding an electron-detaching gas, carbon monoxide, increased the low field impedance until the difference between the forms essentially ceased to exist. Mass spectra measurements indicated that the atomic oxygen density increased significantly when the discharge transitioned from the low to high field forms. Solutions of the Boltzmann transport equation indicated that the electron energy distribution function exhibited a characteristic intermediate between Maxwellian and Druyvesteyn.

Resonance Absorption of Laser Light by Warm and Cold Plasmas.
Master's thesis,
John H. Ruble, Jr. Mar 81, 161p Rept no. AFIT/GNE/PH/81-9

This is a study of the mechanisms and results of resonance absorption in warm and cold plasmas. Maxwell's equations and the plasma fluid equations (neglecting ion motion and assuming wavelike solutions in the x-direction) are linearized. The linearization is accomplished for a plasma with a positive number density gradient in the z-direction. Second-order equations are derived from the linearized set. These second-order equations are differenced and solved in the z-direction for the TM mode of propagation using a two-sweep algorithm with zero and radiation boundary conditions. The characteristics of the field quantities are investigated at various temperatures. Further N sub 1 (the plasma wave), the temperature of the hot electrons, and the nonlinear Ponderomotive force are calculated. Finally, resonance absorption by the plasma is calculated and peak absorptions of 50% are observed for both cold and low temperature warm plasmas. The validity of the assumptions is discussed referencing both power and temperature concerns. Possible nonlinear and time-dependent modifications to the theory are discussed. Landau damping is derived and its limitations considered. The two-sweep algorithm is found to give accurate results and its amenability to computer application makes it a desirable method. (Author)

The Finite Element Method Applied to the System-Generated Electromagnetic Pulse Boundary Layer.
Doctoral thesis,
John A. Gaudet. Feb 81, 147p Rept no. AFIT/DS/PH/81-1

The Finite Element Method was used to solve the nonlinear electron plasma equations for the System-Generated Electromagnetic Pulse boundary layer in one spatial dimension. These equations were solved in distance-velocity phase space using a rectangular finite element mesh. Linear approximations were used for both the trial and weight functions for each element. The advection terms in the Vlasov plasma equation were treated with the Heinrich upwinding technique. The time integration was performed using an explicit two-step Lax-Wendroff procedure. The system of algebraic equations were solved with a fully-packed Gauss-Seidel iteration scheme. A value of 2/3 for the upwinding parameter was found to provide the best compromise between dispersion of the pulse, and computer storage requirements. The savings in computer memory results in increased execution speed for the algorithm. Also, it is shown that the numerical scheme does not permit spurious pulse reflections from the edges of the mesh. Results for several test cases are presented. Comparisons are given which show favorable agreement for the finite element technique with other solution relationships.

Studies of Autoionizing States Relevant to Dielectronic Recombination. Progress Report for the Third Year.
T. F. Gallagher. 5 Jan 81, 22p
Contract AT03-79ER10376

An important loss process in CTR plasmas is the process of dielectronic recombination, which proceeds via autoionizing states. At this date, however, this problem is not fully understood, largely because of the nearly complete lack of fundamental atomic data on high excited autoionizing states. In this document, we outline the continuation of a program to investigate the properties of autoionizing states of alkaline earth metals by means of a novel laser excitation technique developed at SRI. This approach will allow us to study, for the first time, autoionizing states of arbitrary n, and l in a controlled environment. Specifically, we plan to measure autoionization rates and branching ratios as a function of n and l and the effects of electric fields. These experiments should yield the basic atomic data, autoionization rates, required as inputs to sophisticated model calculations of dielectronic recombination rates. (ERA citation 06:024553)

Revision of report dated Sep 79. Prepared in cooperation with Southhampton Univ. (England). Dept. of Mathematics and State Univ. of New York, Buffalo. Dept. of Mathematics.

The purpose of this paper is to study the traction problem in three dimensional nonlinear elasticity using geometric techniques and singularity theory. The first two papers in the series deal with dead loads and configurations that are nearly stress free. As was shown by Signorini (1930) and Stoppelli (1958), this problem has nontrivial solutions. However, their analysis is incomplete for three reasons. First, their load was varied only by a scalar factor; in a full neighborhood in load space of a load which has an axis of equilibrium there are additional solutions missed by their analysis. Second, their analysis is only local in the rotation group, so additional nearly stress free solutions are missed by restricting to rotations near the identity. Third, some classes of loads with a degenerate axis of equilibrium were not considered. This paper completes their analysis by treating these questions as well as stability. The complexity of the answer is indicated by the fact that near certain types of loads, we find up to 40 distinct solutions that are nearly stress free. Our constitutive hypotheses on

the stress tensor are 'generic'; for a degenerate stress tensor there can be even more solutions.

Finite-Element Nonlinear Transient Response Computer Programs PLATE 1 and CIVM-PLATE 1 for the Analysis of Panels Subjected to Impulse or Impact Loads.
R. L. Spilker, E. A. Witmer, S. E. French, and J. J. A. Rodal. Sep 80, 497p NASA-CR-165215, ASRL-TR-154-14
Contract NGR-22-009-339

Two computer programs are described for predicting the transient large deflection elastic viscoplastic responses of thin single layer, initially flat unstiffened or integrally stiffened, Kirchhoff-Lov ductile metal panels. The PLATE 1 program pertains to structural responses produced by prescribed externally applied transient loading or prescribed initial velocity distributions. The collision imparted velocity method PLATE 1 program concerns structural responses produced by impact of an idealized nondeformable fragment. Finite elements are used to represent the structure in both programs. Strain hardening and strain rate effects of initially isotropic material are considered.

Effective Constitutive Relations for Large Repetitive Frame-Like Structures.
Semiannual Progress Report, period ending 30 Apr. 1981.
A. H. Nayfeh, and M. S. Hefzy. 1981, 33p NASA-CR-164521
Grant NSG-1185

Effective mechanical properties for large repetitive framelike structures are derived using combinations of strength of material and orthogonal transformation techniques. Symmetry considerations are used in order to identify independent property constants. The actual values of these constants are constructed according to a building block format which is carried out in the three consecutive steps: (1) all basic planar lattices are identified; (2) effective continuum properties are derived for each of these planar basic grids using matrix structural analysis methods; and (3) orthogonal transformations are used to determine the contribution of each basic set to the overall effective continuum properties of the structure.

Formulae for the Homogeneous Isotropic Perfectly Linear Elastic Continuum,
H. G. Denkhaus. Jul 80, 83p CSIR-ME-1665, ISBN-0-7988-1469-1

This is the second, corrected and extended edition of a collection of formulae which was compiled to provide a reference manual of the basic equations of the classical theory of elasticity. It is believed that this systematic collection will be useful for the engineer and the student when reading papers related to elasticity, where the authors obviously cannot go back to the fundamentals but must assume that the reader has a basic knowledge of the theory.

Magnetostriction and Characterization of Bridgman Grown Rare-Earth Iron Alloys.
Technical rept.,
H. T. Savage, R. J. Abbundi, and A. E. Clark. 1 Nov 80, 19p Rept no. NSWC/TR-81-29

We have prepared large samples of Tb 0.27Dy 0.73Fe2 and Tb 0.2Ho 0.58Dy 0.22Fe2 by a Bridgman-like technique developed at United Technology. The samples have much larger values of saturation magnetostriction than vertically zoned materials. The materials have been characterized by metallographic x-ray and TEM studies. (Author)

Annealing of Boron-Implanted Silicon by a Heat-Assisted Noncoherent Light Flash.
Technical rept.,
H. A. Bomke, H. L. Berkowitz, M. Harmatz, S. Kronenberg, and R. Lux. May 81, 7p Rept no. DELET-TR-81-13

High quality annealing of boron implanted silicon 10 to the 15th power/sq cm, 50 keV) was achieved using commercially available quartz xenon flash tubes after a 20 second preheat. Electrically active dopant profiles, obtained from spreading resistance profiles, indicate that the annealing proceeded by solid phase epitaxy. We also find that the degree of boron redistribution can be controlled by the cumulative exposure to the flash. Characteristics of the apparatus used suggest that annealing 3 inch diameter wafers with a throughput of 3 wafers per minute is feasible. (Author)

Studies of Unexfoliated and Exfoliated Intercalation Graphite.
Technical rept.,
W. L. Garrett, J. Sharma, J. Pinto, and H. Prask. May 81, 15p ARLCD-TR-81008, AD-E400 617

The ongoing study of unexfoliated and exfoliated intercalation graphite is directed towards the understanding of its physical nature, to determine what changes take place when it is exfoliated into a low density solid, and to explore its potential as an obscurant. X-ray photoelectron spectroscopy (XPS) is used for studying the electronic levels; X-ray diffraction is used for crystallographic information, while optical reflectivity is measured to determine its spectral response. It has been found that even after exfoliation the material remains essentially graphite.

System Optimization of the Glow Discharge Optical Spectroscopy Technique Used for Impurity Profiling of Ion Implanted Gallium Arsenide.
Master's thesis,
Paul J. Apuzzo. Dec 80, 73p Rept no. AFIT/GEO/EE/80D-1

The glow discharge optical spectroscopy (GDOS) technique was investigated to determine if the sensitivity of the system could be improved. GDOS was applied to determine impurity concentration profiles of annealed and unannealed ion implanted GaAs samples. Modifications were made to the sputtering chamber and the light collection systems which resulted in a 3.7 times increase in system sensitivity. Comparisons were made to previous studies by sputtering GaAs samples implanted with Ge at energies of 90 keV and 120 keV and fluences of 5 x 10 to the 14th power/sq cm and 10 to the 15th power/sq cm. The implanted samples were sputtered in a low pressure argon gas discharge. Intensity of a strong emission line, characteristic of the implanted impurity, was monitored as a function of time. Profiles of Ge implanted GaAs were measured and analyzed. (Author)

Assessment of Superconductivity Enhancement Claimed to Occur in Small Particle-Normal Metal Matrix Composite Superconductors,
M. Ashkin. 20 Feb 78, 36p
Contract F49620-78-C-0031

The claims of substantially enhanced superconducting transition temperature, T sub c, and upper critical field, H sub c2, are judged implausible. This conclusion was reached by comparing the claims with what is theoretically expected using current theories, experimental results, and concepts of superconductivity of high-T sub c material. However, the Battelle approach holds some promise of achieving both good mechanical and good superconducting properties in a practical conductor. AC losses and proximity effects in the composites need careful consideration in the evolution of a practical composite conductor. (Author)

Final rept.,
Russell E. Hayes. 20 Mar 81, 51p
Contract N00014-75-C-0472

This research program involved the investigation of several aspects of GaxInl-xAsy-Pl-y, grown by LPE, that are of importance to the potential use of this material for field effect transistors, transferred-electron oscillators, and other devices. Results obtained include: various electrical characteristics of the material; the observation that the GaInAsP-InP conduction band discontinuity was less than 60 meV for these junctions; the characteristics of some quaternary transferred electron oscillators; and the properties of anodic oxides grown on the quaternary.

Contract F49620-80-C-0025

The electronic structure and properties of semiconductor interfaces including both vacuum-semiconductor and metal-semiconductor interfaces as well as relevant metal and semiconductor materials have been investigated under this contract. The emphasis has been on elucidating the electronic properties of these materials and their interfaces, e.g., metal-semiconductor Schottky barriers, which are of far reaching importance in such semiconductor devices as MOSFETS, CCD devices, photovoltaic devices, etc. Extensive studies of the electronic structure of semiconductor surfaces and interfaces and related metal surfaces have been performed as a function of surface preparation (include laser annealing), doping, thickness of adsorbed overlayers, etc. The principle technique used has been photoelectron spectroscopy (XPS and UPS - with an emphasis on angle-resolved studies using synchrotron radiation and yield spectroscopy); other techniques include electron energy loss spectroscopy, low energy electron diffraction and theoretical band structure methods. Major achievements of our research program includes world-leading contributions to: (1) the electronic structure of cleaned and annealed Si(111) surfaces; (2) accurate experimental determinations of electron energy vs momentum band dispersions E(k) of selected materials (such E(K) dispersions are of central importance in solid state physics in understanding the electronic, physical and chemical properties of materials); and (3) the development and application of surface core level spectroscopy, a promising new photoemission technique.

Grant AFOSR-78-3714

This final report gives a summary of the experimental and theoretical studies undertaken during the two-year AFOSR grant on the electrical properties and atomic origins of oxide charges and interface states in the silicon oxide-silicon MOS structure. Both UV light and KeV electron are used to probe these interface and oxide states. MOS C-V, G-V and photo I-V measurements are performed under computer control. Experiments have shown that trivalent silicon and nonbridging oxygen are likely to be the principal atomic defects that are responsible for the presence of the interface states and oxide charges. Hydroxyl or hydrogen ions can tie up these dangling bonds and neutralize these atomic defects but bonded H and OH can be readily released by the electrons or holes generated by the 10.2 eV photons or KeV electrons. After the defects are generated, they can be neutralized readily by exposing the MOS capacitor to forming gas (4% H2 and 96% N2) at 390 C for 10 minutes. (Author)

Bansang W. Lee. 10 Jun 81, 15p AFOSR-TR-81-0529
Grant AFOSR-79-0136

Stages 1 and 2 of the proposed program were completed during the first 18 months of this effort. A satellite chamber for device fabrication was designed, built and incorporated into the main high vacuum chamber. The free surface properties of GaAs (110) and GaP (110) were studied using LEED and AES. Reports on this work were presented at scientific meetings. The problem of a wave propagating with losses in a rectangular waveguide was formulated and solved. (Author)

The theoretical techniques used in modeling cracks in crystalline lattices are reviewed. It is shown that there is generally a trade-off between sample size and realistic interatomic potentials. The results of a recent molecular dynamic study of a two-dimensional triangular Lennard-Jones system of about 10,000 atoms are described. Static calculations on this system show very little lattice trapping in contrast to the often quoted results of lattice statics models. Using molecular dynamics, the properties of the system, with and without a crack, are understood sufficiently quantitatively to allow extrapolation to infinite size. At 10,000 atoms size effects are small enough to render the simulation highly reliable. It is also shown that when lattice statics and hybrid lattice statics calculations are performed using realistic, long-range potentials, lattice trapping is small. Dynamic simulations at constant applied stress show an intricate interplay between brittle crack propagation and the tendency to form dislocations. At low stresses the behavior is brittle while dislocation generation and crack blunting is observed at elevated stresses. The velocity of crack propagation has also been studied using a constant applied strain. A constant velocity is attained relatively soon after the crack has begun to propagate at both constant applied stress or strain. The credibility of the various models is discussed.
